# Quantum Computers

Bits in classical computers:

Classical value of a  
bit taken from the  
set:

B

# Quantum Computers

Bits in classical computers Qubits in quantum computers:

0 1 1

Classical value of a  
bit taken from the  
set:

B

$|0\rangle + |1\rangle$

$|0\rangle|1\rangle$

$1|0\rangle$

Quantum value of a qubit:

where and

# Quantum Computers

Quantum measurement:

Any quantum system **that does not interact with the environment** evolves unitarily:

But if you measure the system, its unitary evolution is destroyed.

The outcome of the measurement is truly random.

# Entanglement

Separable states:

Consider a system of 2 particles, whose states are denoted  $\psi_1$  and  $\psi_2$ .  
Suppose:

If the system can be described strictly as  $\psi_1 \otimes \psi_2$ , then it is called a **separable** state.

# Entanglement

Separable states:

May the subsystems A and B be given as:

Thus,

# Entanglement

There are also states that cannot be decomposed onto the tensor product of 2 subsystems:

Example:

# Entanglement

Entangled states:

Physical interpretation of **entangled** states:

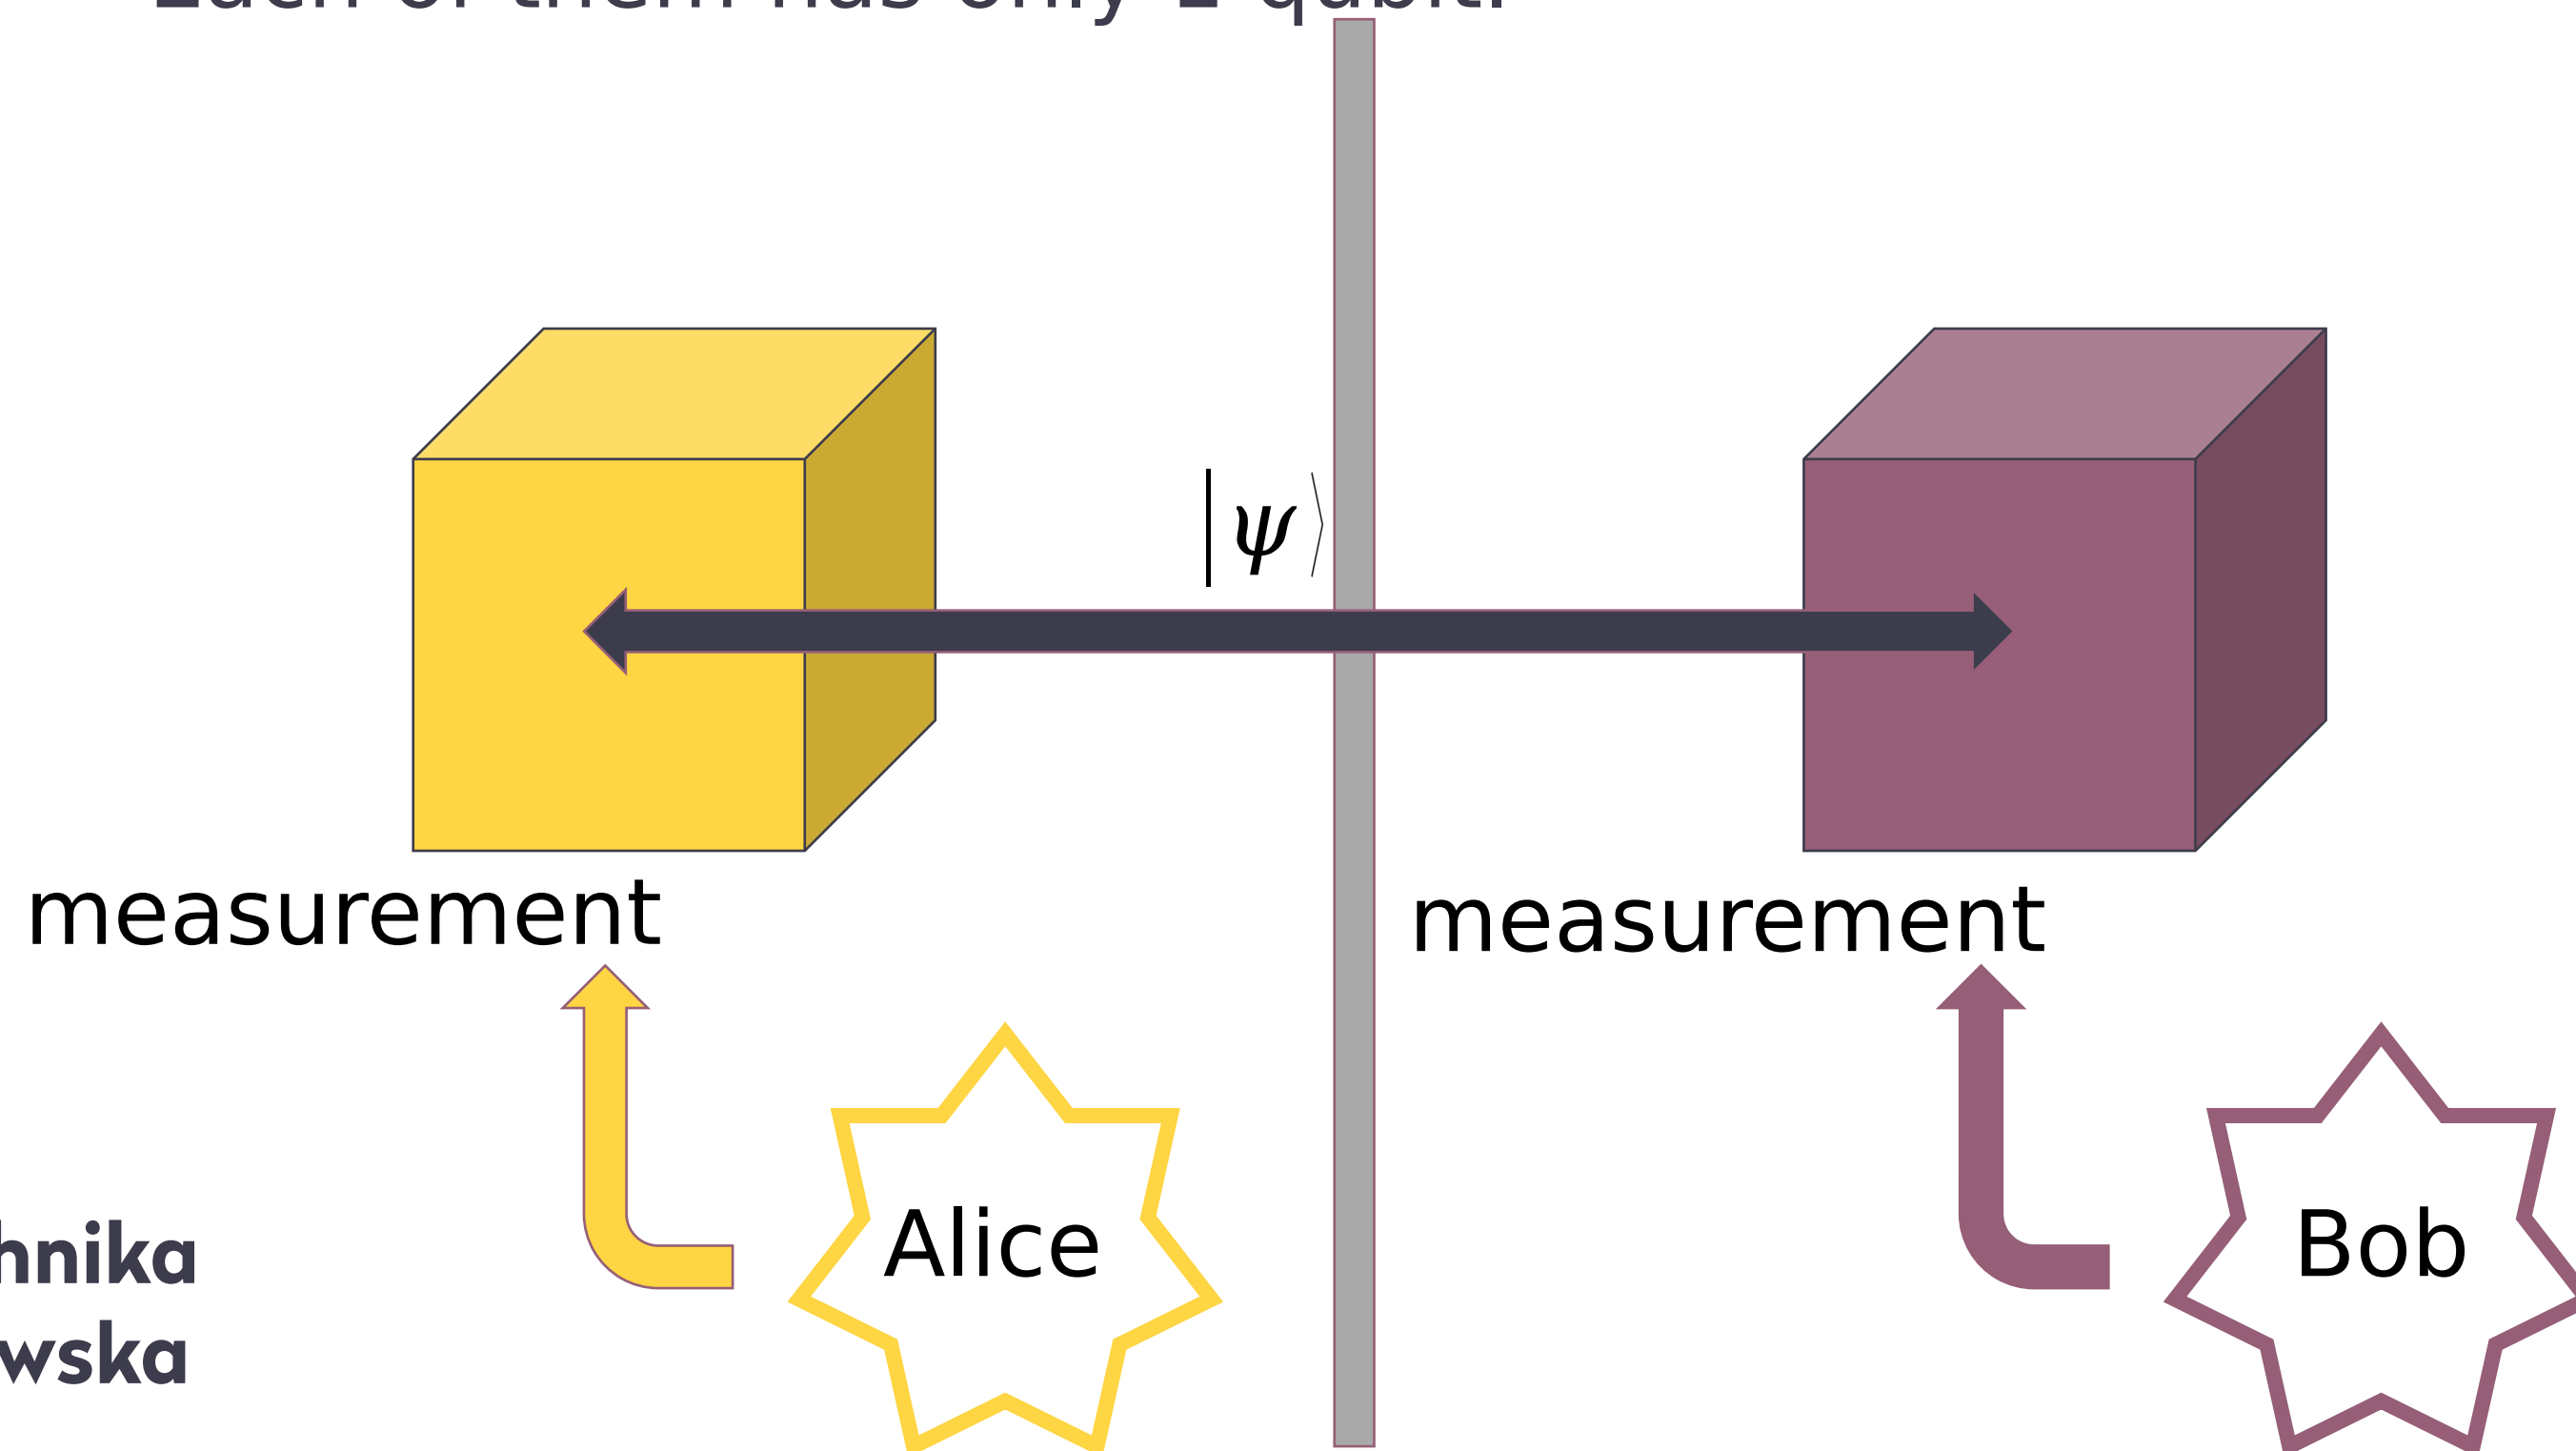

- We know a lot about the whole system ;
- We cannot describe any of the subsystems separately.

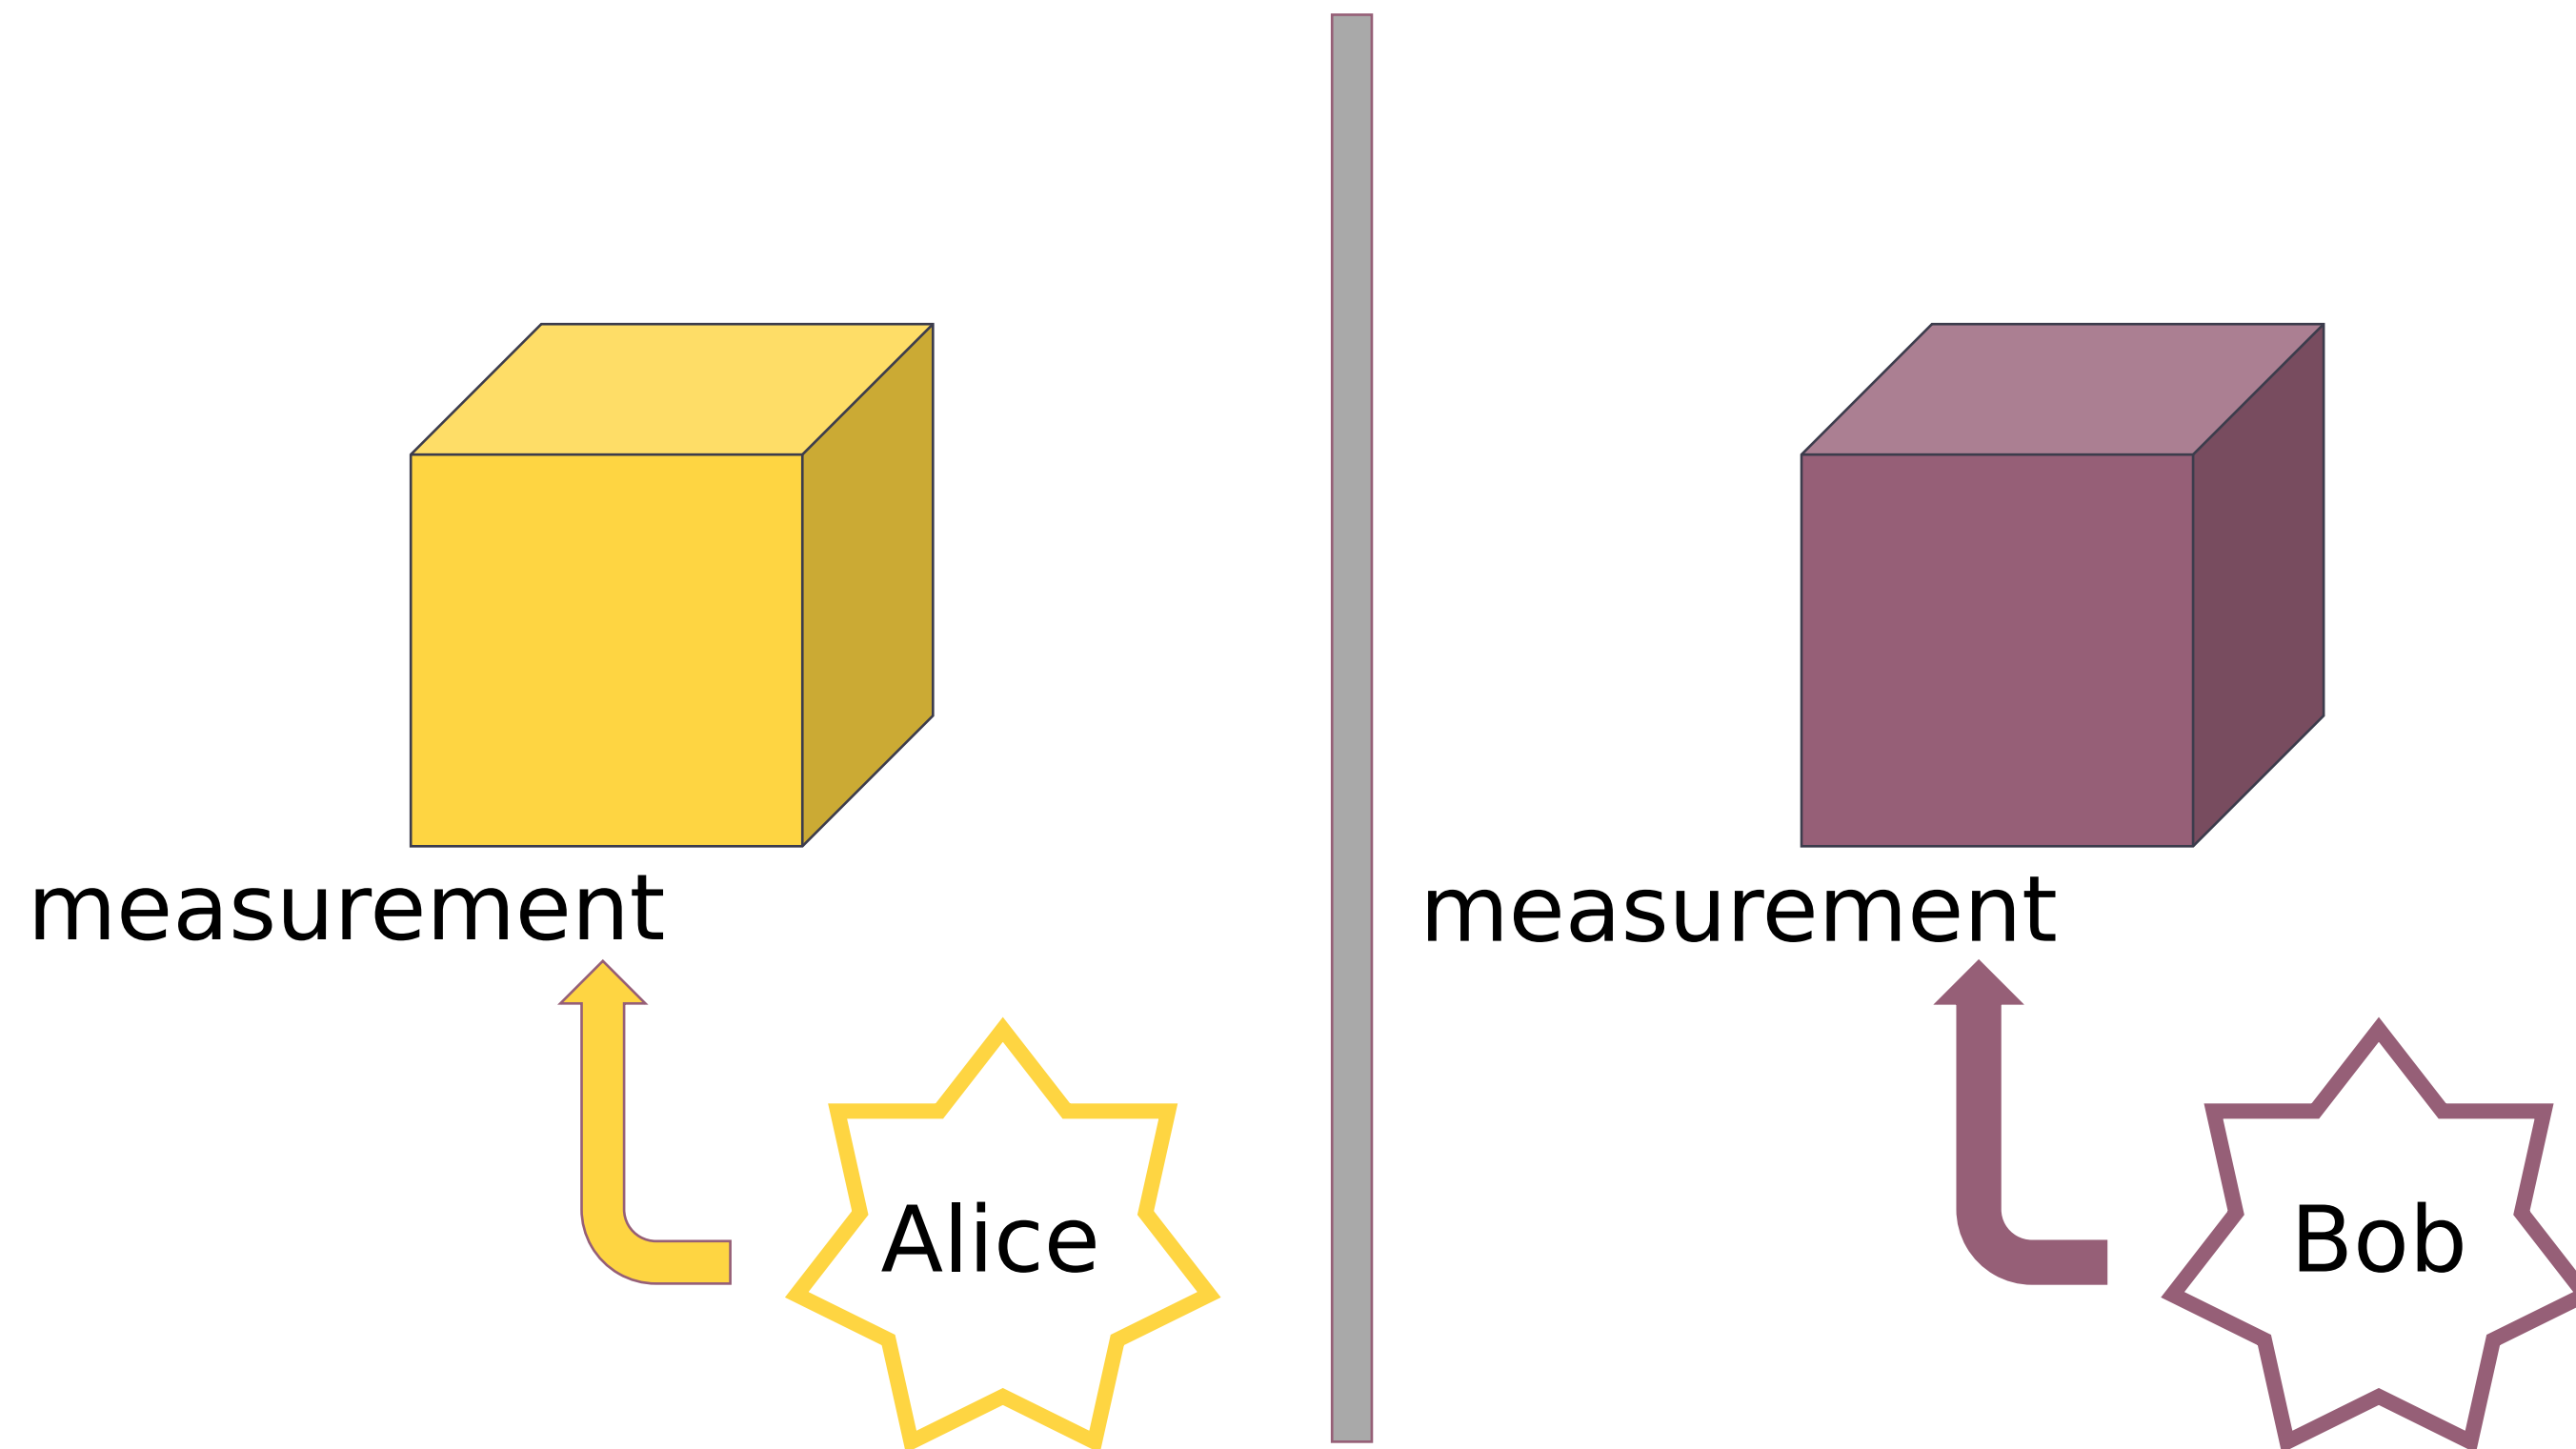

# Bell Scenario

Consider the following system:

- 2 **entangled** qubits that cannot communicate with each other;
- 2 observables are measurable for each qubit;
- 2 scientists, Alice and Bob, are performing the experiment. Each of them has only 1 qubit.

# Bell Scenario

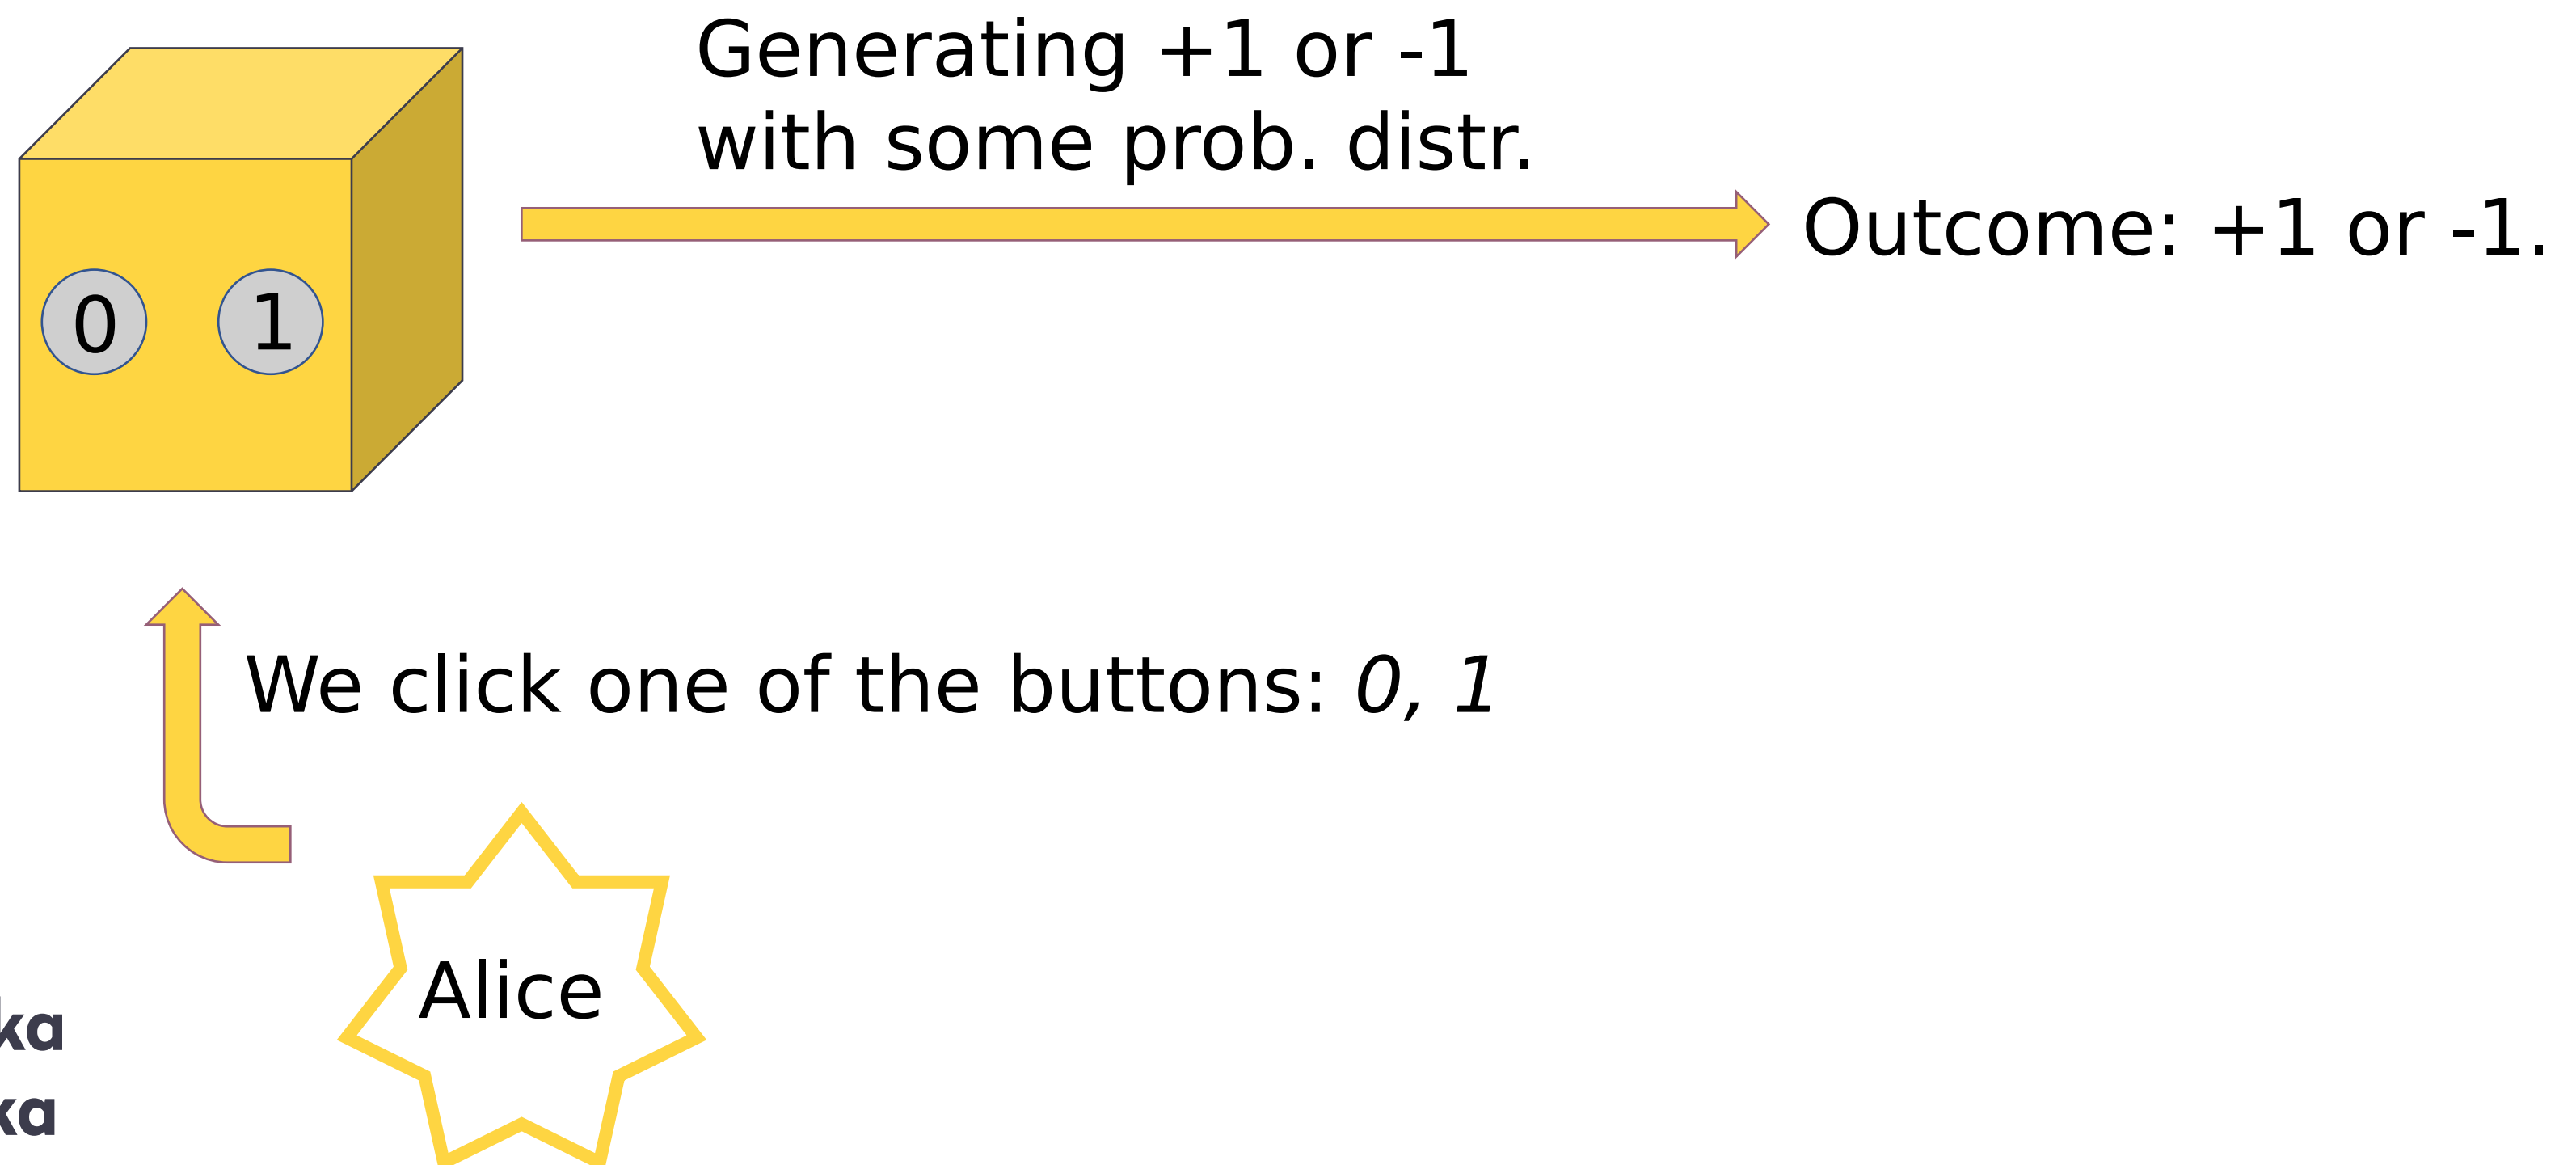

Alice and Bob measure their qubits simultaneously.

They do that many times, collecting the statistics

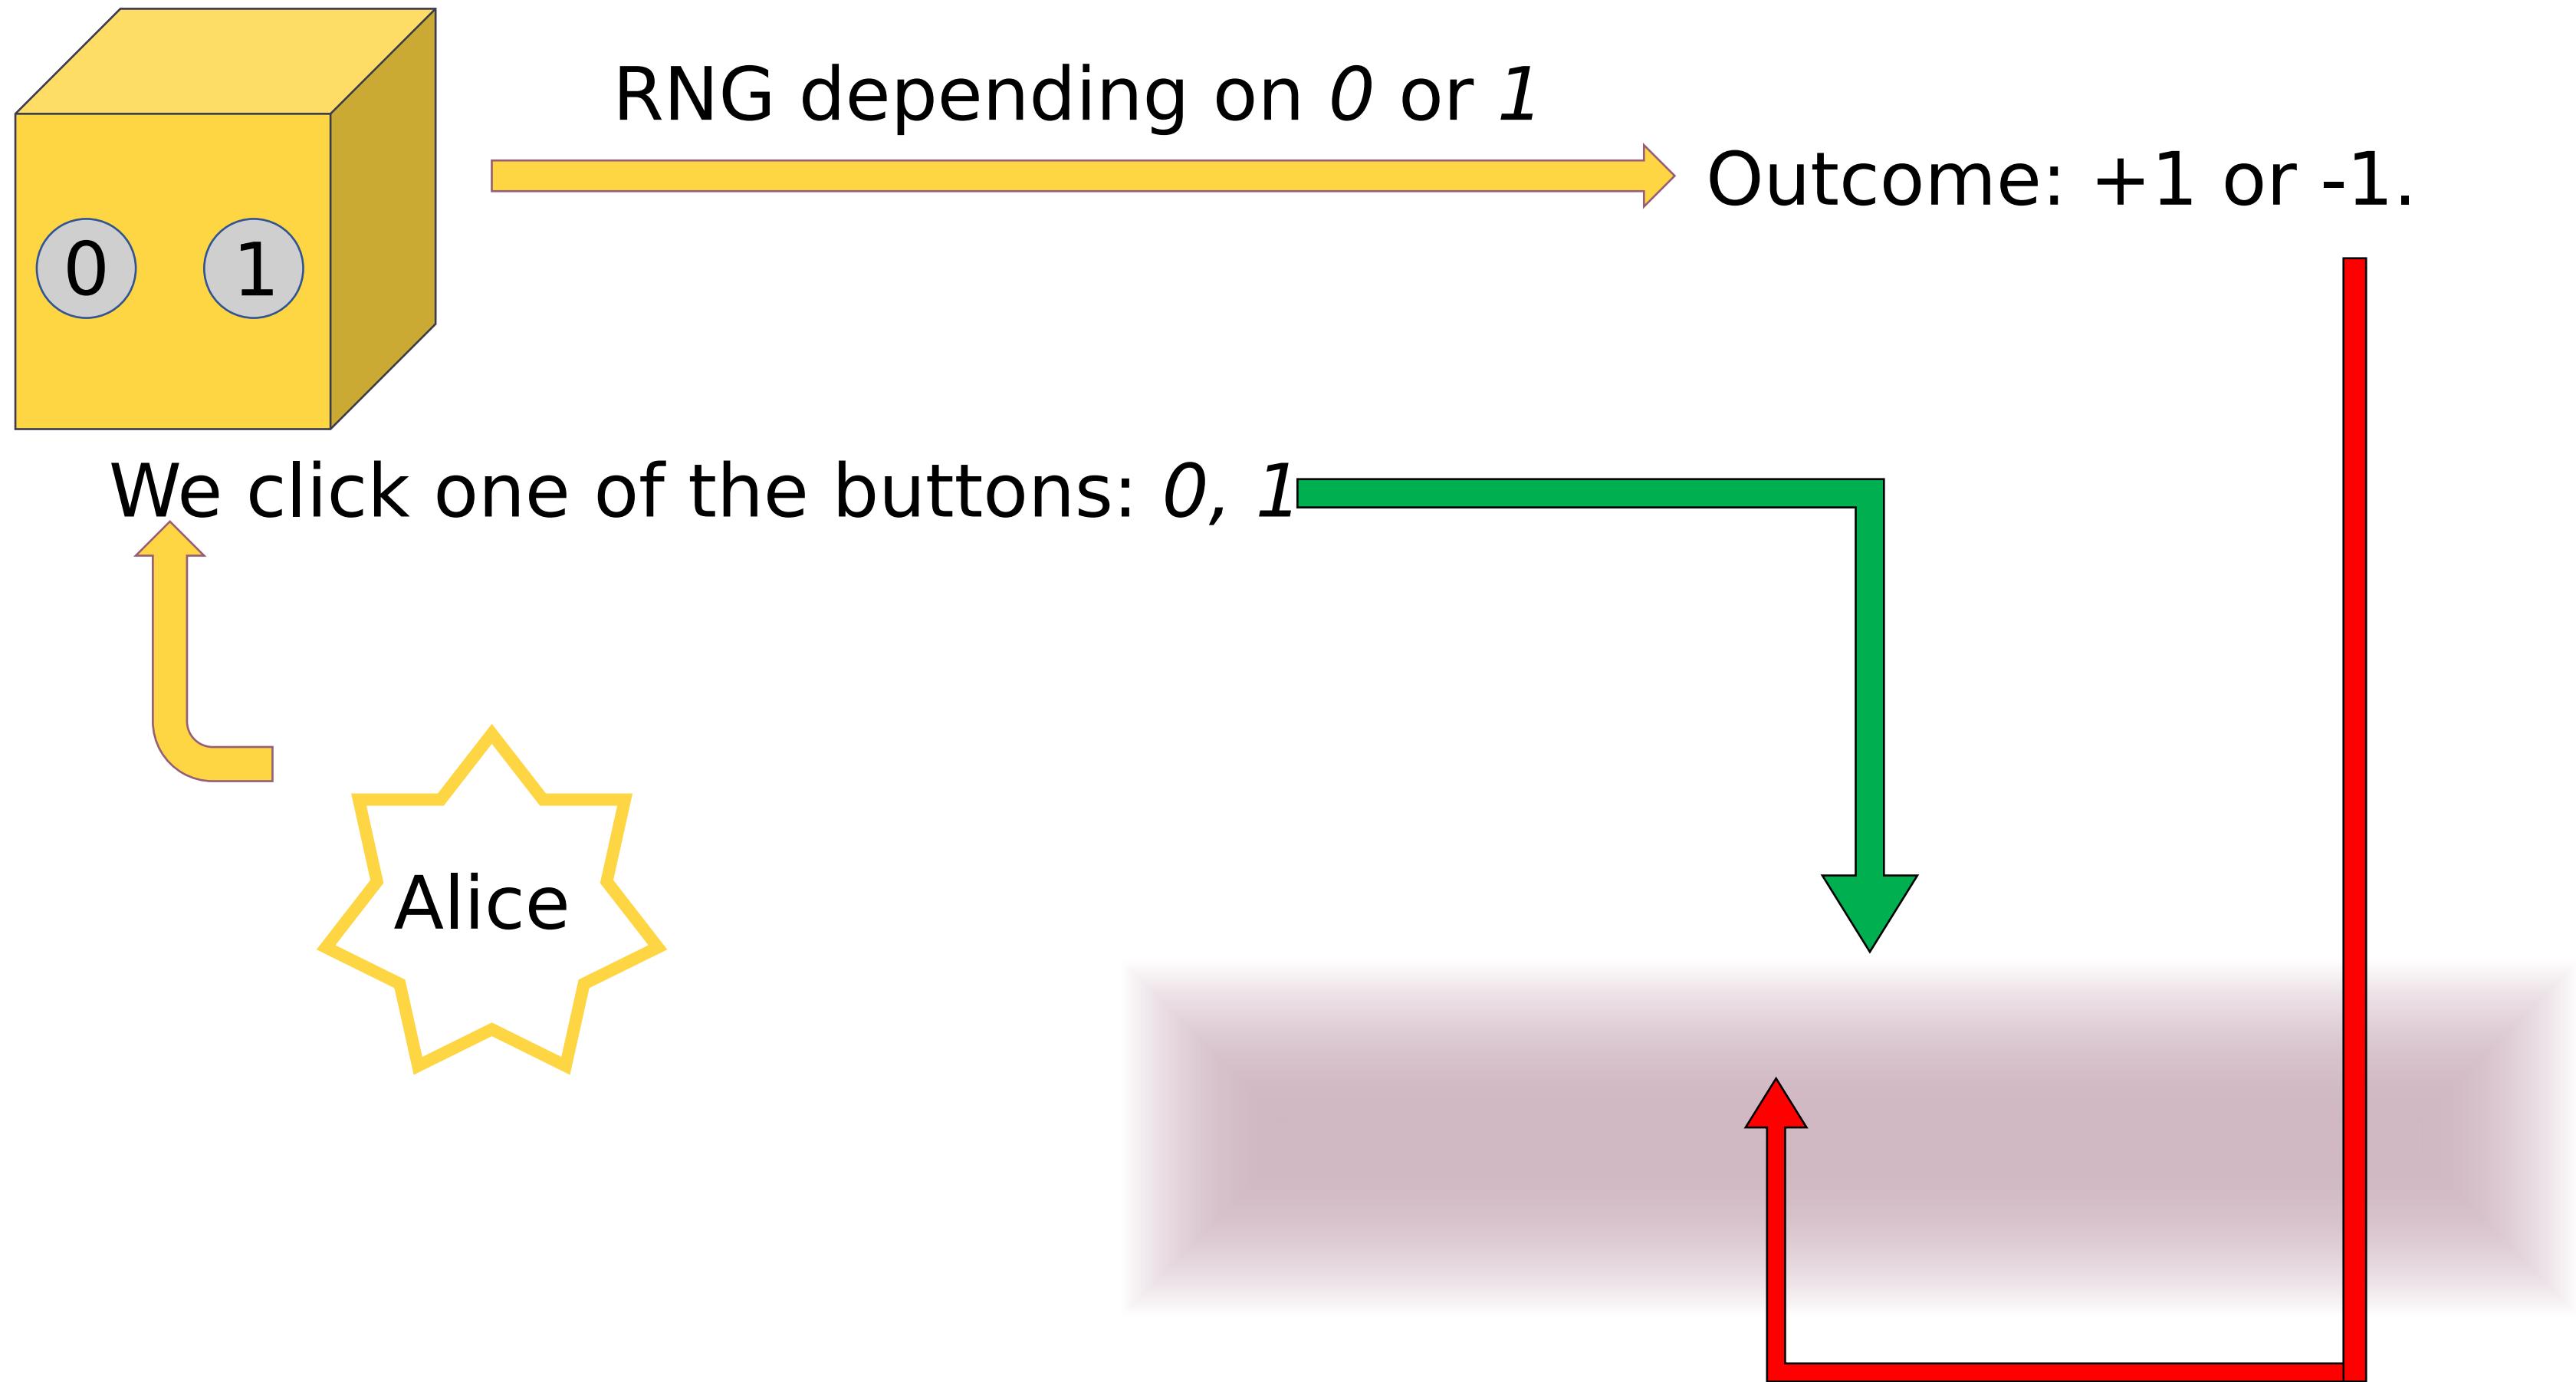

# Bell Scenario

How the system would behave in classical physics?

Classically, the whole experiment could be understood as an RNG:

# Bell Scenario

# Bell Scenario

, but not only.

# Bell Scenario

Locality:

A probability distribution is named **local** if:

so when there exist a phenomenon that explains the behaviour of the system in classical physics.

Otherwise the system is **non-local**.

# Bell Inequalities

Expectation value of a joint measurement:

Locally:

In quantum mechanics (both local and non-local cases):

# Bell Inequalities

Example:

In any local case:

There exist some entangled quantum states that violate such an inequality.

# Bell Inequalities

Example:

The following operators construct a non-local experiment:

We will take this state:

# Bell Inequalities

Example:

In such experiment:

The behaviour of the system is non-local, because .
