How should the access system be operated while LHC is not in beam operation?

Wednesday, 27 January 2010 09:00 (20 minutes)

There are 2 periods where the beams in the LHC machine are stopped; the “Shutdown and Commissioning” period and the “Technical Stop”. This talk will define how these different periods should be organized (scheduling, coordination, safety, access...), and explain how the access system will be operated for personnel safety.

Presenter: COUPARD, Julie

Session Classification: Session 5 - Access System and Radiation Monitors
