## Rare B decays

## at $B$ factories

Karim Trabelsi KEK, IPNS July 27, 2010

35 ${ }^{\text {th }}$ International Conference on High Energy Physics
July 22-28, 2010, Paris

## Outline

Rare and beautiful...

Radiative/EW decays

1. $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}}$ y
2. $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}, \mathrm{d}} \gamma$
3. $\mathrm{B} \rightarrow \mathrm{K}^{(*)} \mathrm{l}^{+} \mathrm{l}^{-}$
4. $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \mathrm{l}^{+} \mathrm{l}^{-}$
5. $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \tau^{+} \tau^{-}$
6. $\mathrm{B} \rightarrow \gamma \gamma$

Tauonic decays
7. $\mathrm{B} \rightarrow \tau v$
8. $\mathrm{B} \rightarrow \mathrm{D}^{(*)} \tau \mathcal{V}$

Exotic decays
9. $\mathrm{B}^{+} \rightarrow \mathrm{D}^{-} \mathrm{l}^{+} \mathrm{l}^{+}$

Charmless had decays
10. $\mathrm{B} \rightarrow \eta^{\prime} \mathrm{h}$
11. $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \eta$
at $Y(5 \mathrm{~S})$
12. rare $B_{s}$
$\left(\mathrm{fb}^{-1}\right) \quad$ Rare B: large samples needed

$\sim 770 \mathrm{MB} \overline{\mathrm{B}}$ for Belle, $\sim 470 \mathrm{MB} \overline{\mathrm{B}}$ for BaBar
$\sim 14 \mathrm{M}_{\mathrm{s}}$ also! ( $(5 \mathrm{~S})$ runs)

## Radiative and Electroweak Penguin Decays

Radiative and Electroweak Penguin Decays are Flavor Changing Neutral Currents (FCNC) occuring in the Standard Model only at the loop level
$\Rightarrow$ high sensitivity to New Physics (NP)
(can appear in the loop with size comparable to leading SM contributions)
$\Rightarrow$ Complementary to the direct production of new particles expected at LHC

Huge datasets collected at the two B-factories, BaBar and Belle, have made it possible to explore precisely these decays in exclusive channels and inclusive measurements

## $\underline{\mathbf{B} \rightarrow \mathbf{X}_{\mathrm{s}} \gamma}$

## $W^{-}$

Sensitive to NP

NNLO SM calculation:
$B_{S M}\left(\mathrm{~B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma\right)=(3.15 \pm 0.23) \times 10^{-4}$ (for $\mathrm{E}_{\gamma}>1.6 \mathrm{GeV}$ )
M.Misiak et al. PRL 98, 022002 (2007)
(see also talk of Soumitra Nandi)

The lower $\gamma$ energy threshold the smaller the model uncertainties in SM,

Charged Higgs (2HDM Type II) bound
 but the larger background in measurement

## $\underline{\mathbf{B} \rightarrow \mathbf{X}_{\mathrm{s}} \boldsymbol{\gamma}}$

inclusive $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma$ measurement untagged
lepton tag: background suppression, low stat

- No kinematic constraints
- Only a high energy photon measured in $Y(4 \mathrm{~S})$ rest frame
- Lower $\mathrm{E}_{\gamma}$ threshold (1.7 GeV)

Continuum bkg. treatment

## $\mathbf{B} \rightarrow \mathbf{X}_{\mathrm{s}} \gamma$ spectrum

PRL 103, 241801 (2009)

Background subtracted

Efficiency corrected and averaged

$$
\boldsymbol{B}\left(\mathbf{B} \rightarrow \mathbf{X}_{\mathrm{s}} \boldsymbol{\gamma}\right)=(\mathbf{3 . 4 5} \pm \mathbf{0 . 1 5} \pm \mathbf{0 . 4 0}) \times \mathbf{1 0}^{-4}\left(\text { for } \mathrm{E}_{\gamma}>1.7 \mathrm{GeV}\right)
$$

- Most precise measurement of $B\left(\mathrm{~B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma\right)$ (lowest $\mathrm{E}_{\gamma}$ threshold)
- Crucial input for global fit to extract $\left|\mathrm{V}_{\mathrm{ub}}\right|$ and $\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma$ decay rate (see Florian Bernlochner's talk)
- $B$ is given for $\mathrm{E}_{\gamma}$ thresholds: 1.7, $1.8,1.9,2.0 \mathrm{GeV}$
- Systematic error is dominated by off -resonance subtraction!

## $\underline{\mathbf{B} \rightarrow \mathbf{X}_{s} \gamma}$

HFAG 2010: $B\left(\mathrm{~B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma\right)=(3.55 \pm 0.26) \times 10^{-4}\left(\right.$ for $\left.\mathrm{E}_{\gamma}>1.6 \mathrm{GeV}\right)$ vs

$$
\mathrm{SM}: B\left(\mathrm{~B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma\right)=(3.15 \pm 0.23) \times 10^{-4}\left(\text { for } \mathrm{E}_{\gamma}>1.6 \mathrm{GeV}\right)
$$

## CLEO [9.1 fb ${ }^{-1}$ ]

 (2001) untag BaBar [82 fb ${ }^{-1}$ ] (2005) sum-of-excl BaBar $\left[82 \mathrm{fb}^{-1}\right]$ (2007) lep-tag BaBar [210 fb ${ }^{-1}$ ] (2008) breco-tag Belle [5.8 fb ${ }^{-1}$ ] (2001) sum-of-excl Belle [605 fb ${ }^{-1}$ ] (2009) untag+lep-tag HFAG 2010

$$

$$

Charged Higss bound (2HDM TypeII) $\mathrm{M}_{\mathrm{H}^{+}}>300 \mathrm{GeV}$

## $\underline{\mathbf{B} \rightarrow \mathbf{X}_{\mathrm{s}, \mathrm{d}} \boldsymbol{\gamma}}$

see Deborah Bard's talk arXiv: 1005.4087

- $471 \mathrm{MB} \overline{\mathrm{B}}$
- Sum of seven exclusive final states:
$\mathrm{B}^{0} \rightarrow \mathrm{~K}^{+} \pi^{-} \gamma, \mathrm{K}^{+} \pi^{-} \pi^{0} \gamma, \mathrm{~K}^{+} \pi^{-} \pi^{+} \pi^{-} \gamma, \mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \pi^{0} \gamma, \mathrm{~K}^{+} \pi^{-} \pi^{+} \gamma, \mathrm{K}^{+} \pi^{-} \pi^{+} \pi^{0} \gamma, \mathrm{~K}^{+} \eta \gamma$

$B\left(\mathrm{~B} \rightarrow \mathrm{X}_{\mathrm{s}} \gamma\right)=$ $\left(23.0 \pm 0.8_{\text {stat }} \pm 3.0_{\text {syst }}\right) \times 10^{-5}$ $\left(\mathrm{M}\left(\mathrm{X}_{\mathrm{s}}\right)<2.0 \mathrm{GeV}\right)$
- Sum of seven exclusive final states:
$\mathrm{B}^{0} \rightarrow \pi^{+} \pi^{-} \gamma, \pi^{+} \pi^{-} \pi^{0} \gamma, \pi^{+} \pi^{-} \pi^{+} \pi^{-} \gamma, \mathrm{B}^{+} \rightarrow \pi^{+} \pi^{0} \gamma, \pi^{+} \pi^{-} \pi^{+} \gamma, \pi^{+} \pi^{-} \pi^{+} \pi^{0} \gamma, \pi^{+} \eta \gamma$

$$
\begin{aligned}
& B\left(\mathrm{~B} \rightarrow \mathrm{X}_{\mathrm{d}} \gamma\right)= \\
& \left(9.2 \pm 2.0_{\text {stat }} \pm 2.3_{\text {syst }}\right) \times 10^{-6} \\
& \quad\left(\mathrm{M}\left(\mathrm{X}_{\mathrm{d}}\right)<2.0 \mathrm{GeV}\right) \\
& \text { mass range covers } \sim 60 \% \\
& \text { of total spectrum in } \mathrm{b} \rightarrow \mathrm{~s}, \mathrm{~d} \gamma
\end{aligned}
$$

$\left|\mathbf{V}_{\mathrm{td}}\right| /\left|\mathbf{V}_{\mathrm{ts}}\right|$ using... $\ldots$...inclusive $X_{s, d} \gamma$

B-mixing average :

$$
\frac{\left|\mathrm{V}_{\mathrm{td}}\right|}{\left|\mathrm{V}_{\mathrm{ts}}\right|}=0.2059 \pm 0.001_{\exp } \pm 0.008_{\mathrm{th}}
$$ arXiv: 1005.4087

$$
\Rightarrow \frac{\left|V_{\text {td }}\right|}{\left|V_{\text {ts }}\right|}=0.199 \pm 0.022_{\text {stat }} \pm 0.012_{\text {syst }} \pm 0.027_{\text {extrapol }} \pm 0.002_{\text {th }}
$$

...exclusive modes: $\mathrm{B} \rightarrow(\rho / \omega) \gamma, \mathrm{K}^{*} \gamma$ theory error $\sim 1 \%$

$\Rightarrow \frac{\left|\mathbf{V}_{\mathrm{td}}\right|}{\left|\mathbf{V}_{\mathrm{ts}}\right|}=\mathbf{0 . 2 0 7} 7_{-0.032}^{+0.030}$
theory error $\sim 8 \%$

## $\mathbf{b} \rightarrow \mathbf{s l}^{+} \mathbf{I}^{-}$

$\Rightarrow 2$ orders of magnitude smaller than $\mathrm{b} \rightarrow \mathrm{s} \gamma$ but rich NP search potential

\author{

- electromagnetic penguin: $\mathrm{C}_{7}$ <br> Amplitudes from <br> 。 vector electroweak: $\quad \mathrm{C}_{9}$ <br> - axial-vector electroweak: $\mathrm{C}_{10}$
}
may interfere
w/ contributions from NP

Many observables:

- Branching fractions
- Isospin asymmetry ( $\mathrm{A}_{\mathrm{I}}$ )
- Lepton forward-backward asymmetry ( $\mathrm{A}_{\mathrm{FB}}$ )
(many other observables: Tobias Hurth's talk)
$\Rightarrow$ Exclusive $\left(\mathrm{B} \rightarrow \mathrm{K}^{(*)} \mathrm{l}^{+} \mathrm{l}^{-}\right)$, Inclusive $\left(\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \mathrm{l}^{+} \mathrm{l}^{-}\right)$

## Exclusive $B \rightarrow \mathbf{K I}^{+} \mathbf{1}^{-}$and $\mathbf{B} \rightarrow \mathbf{K}^{*} \mathbf{1}^{+} \mathbf{1}^{-}$

$$
\mathrm{K}=\mathrm{K}^{+} \text {or } \mathrm{K}_{\mathrm{S}}^{0}, \mathrm{~K}^{*}=\mathrm{K}^{* 0} \rightarrow \mathrm{~K}^{+} \pi^{-}, \mathrm{K}^{*+} \rightarrow \mathrm{K}_{\mathrm{s}}^{0} \pi^{+}, \mathrm{K}^{+} \pi^{0}, \mathrm{l}=\mathrm{e} \text { or } \mu
$$

Various observables: Forward-backward asymmetry, $\mathrm{F}_{\mathrm{L}}$, isospin, lepton flavor...

$\sim 250 \mathrm{~K}^{*} \mathrm{l}^{+} \mathrm{l}^{-}$events
$\sim 160 \mathrm{Kl}^{+} \mathrm{l}^{-}$events

$$
A_{\mathrm{FB}}\left(\mathrm{q}^{2}\right)=-\mathrm{C}_{10}^{\mathrm{eff}} \xi\left(\mathrm{q}^{2}\right)\left[\operatorname{Re}\left(\mathrm{C}_{9}^{\mathrm{eff}}\right) \mathrm{F}_{1}+\frac{1}{\mathrm{q}^{2}} \mathrm{C}_{7}^{\mathrm{eff}} \mathrm{~F}_{2}\right]
$$

$\mathrm{C}_{7}=-\mathrm{C}_{7}^{\mathrm{SM}}$
SM

No crossing ? opposite sign $\mathrm{C}_{7}$ ?

PRL 103, 171801 (2009)

$$
\mathrm{q}^{2}=\mathrm{m}_{\mathrm{l}^{+}+1}^{2}
$$

Hints of anomalously large positive $\mathrm{A}_{\mathrm{FB}}$ at low and high $\mathrm{q}^{2}$
similar situation in BaBar's case PRD 79, 031102 (2009) being updated

## $\mathbf{b} \rightarrow \mathbf{s} \gamma, \mathbf{s l}^{+} \mathbf{l}^{-}$and Wilson coefficients

NP effects can be parameterized as deviations from SM in Wilson coefficients $\mathrm{C}_{7}, \mathrm{C}_{9}, \mathrm{C}_{10}: \mathrm{C}_{\mathrm{i}}=\mathrm{C}_{\mathrm{i}}^{\mathrm{SM}}+\mathrm{C}_{\mathrm{i}}^{\mathrm{NP}}$

$$
\left.\underline{b \rightarrow s \gamma} \text { (sensitive to }\left|C_{7}\right| \text { only }\right)
$$

$$
\begin{aligned}
B(\mathrm{~b} \rightarrow \mathrm{~s} \gamma)= & \frac{\mathrm{G}_{\mathrm{F}}^{2} \alpha_{\mathrm{em}} \mathrm{~m}_{\mathrm{b}}^{5}\left|\mathrm{~V}_{\mathrm{ts}}^{*} \mathrm{~V}_{\mathrm{tb}}\right|^{2}}{32 \pi^{4}}\left|\mathrm{C}_{7}^{\text {eff }}\right|^{2}+\text { corr. } \\
& \underline{\mathrm{b} \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}\left(\text {sensitive to } \mathrm{C}_{7} \text { sign, } \mathrm{C}_{9}, \mathrm{C}_{10}\right)} \text { ) }
\end{aligned}
$$

$$
\begin{aligned}
& \frac{\mathrm{d} \Gamma\left(\mathrm{~b} \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}\right)}{\mathrm{dq}^{2}}=\left(\frac{\alpha_{\mathrm{em}}}{4 \pi}\right)^{2} \frac{\mathrm{G}_{\mathrm{F}}^{2} \mathrm{~m}_{\mathrm{b}}^{5}\left|\mathrm{~V}_{\mathrm{ts}}^{*} \mathrm{~V}_{\mathrm{tb}}\right|^{2}}{48 \pi^{3}}\left(1-\mathrm{q}^{2}\right)^{2} \\
& \quad \times\left[\left(1+2 \mathrm{q}^{2}\right)\left(\left|\mathrm{C}_{9}^{\text {eff }}\right|^{2}+\left|\mathrm{C}_{10}^{\text {eff }}\right|^{2}\right)+4\left(1+\frac{2}{\mathrm{q}^{2}}\right)\left|\mathbf{C}_{7}^{\text {eff }}\right|^{2}+12 \operatorname{Re}\left(\mathbf{C}_{7}^{\text {eff }} \mathrm{C}_{9}^{\text {eff }}\right)\right]+\mathrm{corr}
\end{aligned}
$$

Inclusive differential branching fraction is sensitive to Wilson coefficients (no form factor uncertainties of $B \rightarrow \mathrm{~K}^{*} \mathrm{l}^{+} \mathrm{l}^{-}$)

Opposite-sign $\mathrm{C}_{7}$ makes the branching fraction larger (in SM, $\mathrm{C}_{7}<0$ and $\left.\mathrm{C}_{9}>0\right)$

## $\mathbf{B} \rightarrow \mathbf{X}_{\mathbf{s}} \mathbf{I}^{+} \mathbf{1}^{-}$

Full inclusive measurement is not feasible so far, sum-of-exclusive technique has been used by Belle/BaBar
$\mathrm{X}_{\mathrm{s}}$ reconstructed by: $1\left(\mathrm{~K}^{ \pm}\right.$or $\left.\mathrm{K}_{\mathrm{s}}\right)+4 \pi^{\prime} \mathrm{s}\left(\mathrm{N} \pi^{0} \leq 1\right)$ ( 36 modes)
$\Rightarrow$ Belle ( $657 \mathrm{MB} \overline{\mathrm{B}}$ ), preliminary (previous $152 \mathrm{MB} \overline{\mathrm{B}}$ )

$10 \sigma$ signal for entire $\mathrm{M}\left(\mathrm{X}_{\mathrm{s}}\right)$

$3 \sigma$ signal for $\mathrm{M}\left(\mathrm{X}_{\mathrm{s}}\right)>1.0 \mathrm{GeV}$

Combinatorial BG (semi-leptonic B decays, continuum)

- Self Cross-Feed
$\square$ Peaking BG B $\rightarrow \mathrm{X}_{\mathrm{s}} \pi^{+} \pi^{-}$(double mis-id), leakage from $\mathrm{J} / \psi$ and $\psi^{\prime}$ veto, charmonium higher resonances...

## $\mathbf{B} \rightarrow \mathbf{X}_{\mathbf{s}} \mathbf{l}^{+} \mathbf{1}^{-}$

$B\left(B \rightarrow \mathbf{X}_{\mathrm{s}} \mathbf{1}^{+} \mathbf{1}^{-}\right)=\left(\mathbf{3 . 3 3} \pm \mathbf{0 . 8 0}_{-\mathbf{0 . 2 4}}^{+0.19}\right) \times \mathbf{1 0}^{-6}$
$\left[\mathrm{q}^{2}>0.2 \mathrm{GeV}^{2} / \mathrm{c}^{4}\right.$, extrapolated for $\mathrm{J} / \psi, \psi^{\prime}$, and $\left.\mathrm{M}\left(\mathrm{X}_{\mathrm{s}}\right)>2.0 \mathrm{GeV}\right]$
HFAG average: $B=\left(3.66_{-0.77}^{+0.76}\right) \times 10^{-6}$
SM (Ali et al) : $B_{S M}=(4.2 \pm 0.7) \times 10^{-6}$
SM (Gambino et al): $B_{S M}=(4.4 \pm 0.7) \times 10^{-6}$
PRL 94, 061803 (2005)

## $\mathbf{q}^{2}$ spectrum in $\mathbf{B} \rightarrow \mathbf{X}_{\mathbf{s}} \mathbf{l}^{+} \mathbf{I}^{-}$

$\Rightarrow$ No branching fraction enhancement in this region strongly disfavor the case with the flipped sign of $\mathbf{C}_{7}$
(other less extreme NP possibilities are still allowed)

## $\mathrm{B}^{+} \rightarrow \mathrm{K}^{+}{\tau^{+}}^{-}$

$0.6 \leq \hat{S} \leq 1$ :

$$
\begin{aligned}
& B_{S M}\left(\mathrm{~B}^{+} \rightarrow \mathrm{Xe}^{+} \mathrm{e}^{-}\right)=8.5 \times 10^{-7} \\
& B_{S M}\left(\mathrm{~B}^{+} \rightarrow \mathrm{X} \mu^{+} \mu^{-}\right)=8.5 \times 10^{-7} \\
& B_{S M}\left(\mathrm{~B}^{+} \rightarrow \mathrm{X}^{+} \tau^{-} \tau^{-}\right)=4.3 \times 10^{-7}
\end{aligned}
$$

- rate can be enhanced by NP
(NMSSM rate could be $\propto\left(\mathrm{M}_{\mathrm{T}}^{2} / \mathrm{M}_{\mu}^{2}\right) \sim 280$ )
$\circ \mathrm{B}^{+} \rightarrow \mathrm{K}^{+} \tau^{+} \tau^{-}$is $\sim 50 \%$ of total inclusive rate

Expected Bckg: 65 $\pm 7$
Data events: 47

20
$q^{2}\left[\mathrm{GeV}^{2} / \mathrm{c}^{4}\right]$

- First search (preliminary)

(2-4 neutrinos in the final state)
$B\left(B^{+} \rightarrow \mathrm{K}^{+} \tau^{+} \tau^{-}\right)<3.3 \times 10^{-3} @ \mathbf{9 0} \%$ C.L.

## $\mathbf{B}_{d} \rightarrow \gamma \gamma$

$$
B_{S M} \sim 3 \times 10^{-8}
$$

Bosch and Buchalla JHEP 0208:054 (2002)

$$
\left(B_{S M}\left(\mathrm{~B}_{\mathrm{s}} \rightarrow \gamma \gamma\right) \sim 1 \times 10^{-6}\right)
$$

after continuum background rejection and $\pi^{0}, \eta$ vetoes 2 d fit to $\mathrm{m}_{\mathrm{ES}}$ and $\Delta \mathrm{E}, \mathrm{N}_{\mathrm{S}}=21.3_{-11.8}^{+12.8} \pm 1.4$

$$
B\left(\mathbf{B}^{0} \rightarrow \gamma \gamma\right)<3.2 \times 10^{-7} @ 90 \% \text { C.L. }
$$

[^0]
## Tauonic B decays

$B \rightarrow \tau$

$$
B_{\mathrm{SM}}\left(\mathrm{~B}^{+} \rightarrow \tau^{+} v\right)=\frac{\mathrm{G}_{\mathrm{F}}^{2} \mathrm{~m}_{\mathrm{B}} \mathrm{~m}_{\tau}^{2}}{8 \pi}\left(1-\frac{\mathrm{m}_{\tau}^{2}}{\mathrm{~m}_{\mathrm{B}}^{2}} \mathrm{f}_{\mathrm{B}}^{2}\left|\mathrm{~V}_{\mathrm{ub}}\right|^{2} \tau_{\mathrm{B}}\right.
$$

2 HDM (type II) : $B\left(\mathrm{~B}^{+} \rightarrow \boldsymbol{\tau}^{+} v\right)=B_{\mathrm{SM}} \times\left(1-\frac{\mathrm{m}_{\mathrm{B}}^{2}}{\mathrm{~m}_{\mathrm{H}^{+}}^{2}} \tan ^{2} \beta\right)^{2}$
uncertainties from $f_{B}$ and $\left|V_{u b}\right|$ can be reduced to $B_{B}$ and other CKM uncertainties by combining with precise $\Delta \mathrm{m}_{\mathrm{d}}$

## $\underline{\mathbf{B} \rightarrow \mathbf{D}^{(*)} \boldsymbol{\tau} \mathcal{V}}$

2 HDM (type II): $B\left(\mathrm{~B} \rightarrow \mathrm{D} \tau^{+} v\right)=\mathrm{G}_{\mathrm{F}}^{2} \tau_{\mathrm{B}}\left|\mathrm{V}_{\mathrm{cb}}\right|^{2} \mathrm{f}\left(\mathrm{F}_{\mathrm{V}}, \mathrm{F}_{\mathrm{S}}, \frac{\mathrm{m}_{\mathrm{B}}^{2}}{\mathrm{~m}_{\mathrm{H}^{+}}^{2}} \tan ^{2} \beta\right)$
uncertainties from form factors $\mathrm{F}_{\mathrm{v}}$ and $\mathrm{F}_{\mathrm{S}}$ can be studied with $\mathrm{B} \rightarrow \mathrm{Dl} v$ (more form factors in $\mathrm{B} \rightarrow \mathrm{D}^{*} \tau v$ )

## Event reconstruction in $B \rightarrow \tau \mathcal{v}$

$$
\underline{B}_{\mathrm{sig}} \rightarrow \tau \mathcal{V}
$$

## $\mathbf{B}^{+} \rightarrow \mathbf{D}^{-1} \mathbf{l}^{+} \mathbf{1}^{+}$

Majorana neutrinos allow lepton number violating process as $\mathrm{B}^{+} \rightarrow \mathrm{h}^{-} \mathrm{l}^{+} \mathrm{l}^{+}(\mathrm{h}=\mathrm{D}, \pi \ldots)$

First search of such decay: no event found $\Rightarrow$ will extend to other LV charmful B decays

## $\mathbf{B} \rightarrow \eta^{\prime} \mathbf{h}$

- $B\left(\mathrm{~B} \rightarrow \eta^{\prime} \mathrm{K}\right)>B\left(\mathrm{~B} \rightarrow \eta^{\prime} \mathrm{K}^{*}\right)$ (whereas $B\left(\mathrm{~B} \rightarrow \eta \mathrm{~K}^{*}\right)>B(\mathrm{~B} \rightarrow \eta \mathrm{~K})$ )
- poor agreement between Belle and BaBar for $\mathrm{B}^{+} \rightarrow \eta^{\prime} \rho^{+}$
(see Alessandro Gaz's talk) arXiv: 1004.0240

- confirm $B\left(\mathrm{~B} \rightarrow \eta^{\prime} \mathrm{K}\right)>B\left(\mathrm{~B} \rightarrow \eta^{\prime} \mathrm{K}^{*}\right)$
- confirm $\mathrm{B}^{+} \rightarrow \eta^{\prime} \rho^{+}$signal
- observe $\mathrm{B}^{+} \rightarrow \eta^{\prime} \mathrm{K}_{0}^{*}(1430)^{0}, \eta^{\prime} \mathrm{K}_{2}^{*}(1430)^{0} \ldots$
$B\left(B \rightarrow \eta^{\prime} K_{2}^{*}(1430)\right)>B\left(B \rightarrow \eta^{\prime} K_{2}^{*}(1430)\right)$ as in $\omega K^{*}$

Unexpected large BF at large $\mathrm{X}_{\mathrm{s}}$ mass

- $657 \mathrm{MB} \overline{\mathrm{B}}$
- Sum of exclusive: $\mathrm{Kn} \pi\left(\mathrm{n} \leq 4, \mathrm{n}_{\pi^{0}} \leq 1\right)$
- $\mathrm{p}_{n}^{\mathrm{cM}}>2.0 \mathrm{GeV} / \mathrm{c}$

Signal yields are extracted by fitting the $\mathrm{M}_{\mathrm{bc}}$ in bins of $\mathrm{M}\left(\mathrm{X}_{\mathrm{s}}\right)$

$\underline{\mathbf{B} \rightarrow \mathbf{X}_{\mathrm{s}} \eta}$

Partial BF in $0.4<\mathrm{M}_{( }\left(\mathrm{X}_{\mathrm{s}}\right)<2.6 \mathrm{GeV} / \mathrm{c}^{2}$

$$
B\left(B \rightarrow \mathbf{X}_{s} \eta\right)=\left(26.1 \pm 3.0_{-2.1}^{+1.9}+4.0(\operatorname{model})\right) \times 10^{-5}
$$

$\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \eta^{\prime}$ from BaBar PRL93, 061801 (2004)

Large signals for $\mathrm{M}\left(\mathrm{X}_{\mathrm{s}}\right)>2 \mathrm{GeV}$ for both $\eta / \eta^{\prime}$ channels rule out $\eta$ ' specific mechanisms (e.g. ''large $\eta$ 'g g coupling' ' $)$

$\mathrm{A}_{\mathrm{CP}}\left(\mathrm{B} \rightarrow \mathrm{X}_{\mathrm{s}} \eta ; \mathrm{M}_{\mathrm{X}_{\mathrm{s}}}<2.6 \mathrm{GeV} / \mathrm{C}^{2}\right)=-0.13 \pm 0.044_{-0.03}^{+0.02}$

$$
\Sigma=2.6 \sigma(\text { incl. syst })
$$

## Rare $B_{s}$ decays

using $1 / 5$ of the $\Upsilon(5 \mathrm{~S})$ data sample available

$\Rightarrow$ complementarity between B-factories and LHCb

Belle can do neutrals, cleaner, but will have less statistics...

## What is coming next?

Finalizing BaBar and Belle results with full data samples...
BaBar: ' 'Two years after the end of the data taking, BaBar continues to exploit its rich dataset, more results will be coming...' (Alessandro Gaz)
Belle:

- reprocessed data sample with improved tracking efficiency
- none of the results shown for rare B decays use full data sample yet
- hadronic tag efficiency improved: effective luminosity improved by factor $\sim \times 2$

$\Rightarrow$ new results coming soon!

## and then... Super $B$ factories!

$\Rightarrow$ physics with $\mathrm{O}\left(10^{10}\right) \mathrm{B}, \tau, \mathrm{D} \ldots$
2 Super B Factories projects: SuperB (in Italy) and SuperKEKB/Belle II (in Japan)
$\Rightarrow$ KEKB upgrade has been approved (see Y.Ushiroda's talk) 100 oku yen ${ }^{(*)}$ for machine (FY 2010-2012)

(*) 100 oku yen $\sim 88.6 \mathrm{M}$ euros (Jul 26, 2010)

## Summary

$\mathrm{b} \rightarrow \mathrm{s} y, \mathrm{~b} \rightarrow \mathrm{~d} y, \mathrm{~b} \rightarrow \mathrm{sl}^{+} \mathrm{l}^{-}, \mathrm{B}^{+} \rightarrow \tau v, \mathrm{~B} \rightarrow \mathrm{D} \tau v \ldots$ measured
$\Rightarrow$ provide tests of SM predictions and interesting BSM constraints

- Charged Higgs bounds from $\mathrm{b} \rightarrow \mathrm{s} \gamma, \mathrm{B}^{+} \rightarrow \tau v, \mathrm{~B}^{+} \rightarrow \mathrm{D} \tau v$
- Constraints on Wilson coefficients $\mathrm{C}_{7}, \mathrm{C}_{9}$ and $\mathrm{C}_{10}$
- Constraints on $\left|\mathrm{V}_{\mathrm{td}}\right| /\left|\mathrm{V}_{\mathrm{ts}}\right|$
$\Rightarrow$ Interesting signatures
- $B\left(\mathrm{~B}^{+} \rightarrow \tau^{+} v\right)$ direct measurement versus CKM fit
- large forward-backward asymmetry of $\mathrm{K}^{*} \mathrm{l}^{+} \mathrm{l}^{-}$

## Final Belle/BaBar data samples are yet to be analyzed !

Even more interesting results at Super B factories with two orders of magnitude larger data samples!

[^0]:    $B$
    $B\left(\mathrm{~B}^{0} \rightarrow \gamma \gamma\right)<6.1 \times 10^{-7} @ 90 \%$ C.L. (using $\left.104 \mathrm{fb}^{-1}\right)$ [PRD73, 051107 (2006)]
