New measurement of the B_{0_s} mixing phase at CDF

Saturday, 24 July 2010 14:30 (13 minutes)

CDF presents improved bounds on the CP-violating phase β_s and on the decay-width difference $\Delta\Gamma_s$ of the neutral B_{0_s} meson system. We use 6500 $B_{0_s} \rightarrow J/\psi \phi$ decays collected by the dimuon trigger and reconstructed in a sample corresponding to 5.2 fb^{-1} of data. Besides exploiting a two-fold increase in statistics with respect to the previous measurement, several improvements have been introduced in the analysis including a fully data-driven flavor-tagging calibration and proper treatment of possible S-wave contributions.
