Measurement of J/ψ , Upsilon and b-hadron production in proton-proton collisions at $\sqrt{s} = 7$ TeV with the CMS experiment

Thursday, 22 July 2010 09:45 (15 minutes)

We present the first measurements of the J/ψ and Y production cross sections in proton-proton collisions at 7 TeV, as measured by the CMS experiment using the dimuon decay channel. For the J/ψ we give the inclusive and the prompt differential cross sections, versus transverse momentum, as well as the beauty fraction, statistically separating the two contributions through a fit to the lifetime distribution, using the distance between the dimuon vertex and the interaction point. For the Y , we present the 1S cross section and the $(2S+3S)/1S$ cross-section ratio, both versus transverse momentum.
