CLIC Progress and Status

Saturday, 24 July 2010 11:40 (20 minutes)

The compact linear collider study (CLIC) is aiming at delivering a conceptual design for a multi-TeV linear electron-positron collider in 2011.

This concept is based on high gradient normal-conducting accelerating structures. The RF power for the acceleration of the colliding beams is produced by a novel Two Beams Acceleration scheme based on extracting power from a high current drive beam that runs in parallel with the main linac through special power extraction structures. In order to establish the feasibility of this concept a number of key issues need to be addressed. A short summary of the progress and status of the corresponding studies will be given.
