

# Discussion points for MP session

- **Can we make injection solid, or at least less wobbly?**
- **How to define, track and enforce envelope of allowed operational parameter space through commissioning?**
- **Do we need a more formal process for authorising progress steps in the commissioning plan? Who decides??**
- **Can the sequencer be made safer?**
- **For LBDS (and other critical MPS systems) what are validations needed after fault/repair/reconfiguration?**
- **Is collimator/protection device interlock threshold management adequate?**
- **Easy overview of collimator positions needed...**
- **Is SMP rock-solid? BCT redundancy??**
- **What are criteria to move up in intensity once we're above safe beam limit?**
