

Charmless Hadronic B Decays

Corry L. Lee

Harvard University
BaBar Collaboration

CKM 2010 – September 9, 2010 – Warwick, U.K.

Charmless Hadronic B Decays

- At B factories:
 - $e^+e^- \rightarrow \Upsilon(4S) \rightarrow B\bar{B}$
- Study $B \rightarrow M_1M_2$ or $M_1M_2M_3$ light mesons
 - Pseudoscalar ($J^P = 0^-$): π, η, η', K
 - Scalar ($J^P = 0^+$): $f_0, K_0^*(1430), \dots$
 - Vector ($J^P = 1^-$): $\rho, \omega, \phi, K^*(892)$
 - Axial Vector ($J^P = 1^+$): $a_1(1260), \dots$
 - Tensor ($J^P = 2^+$): $K_2^*(1430), \dots$
 - etc.

Charmless B Decays Overview

- ~ 100 charmless B decays have been measured with $> 4\sigma$ significance.
- Provides a strong test of theory, requiring calculations to accommodate \mathcal{B} , A_{CP} , f_L , \dots measurements.
- Theoretical description complicated due to the interplay of short- & long-distance QCD effects.
 - Quarks \neq Hadrons.
- The heavy mass of the b quark allows SD contributions to be factored out.
 - See earlier talks (ie. G. Bell, S. Jager)
- Predictions from:
 - QCD Factorization (QCDF)
 - Perturbative QCD (pQCD)
 - Soft-Collinear Effective Theory (SCET)
 - Naïve Factorization (NF)
- Power corrections often have end-point divergences requiring model-dependent solutions & leading to large uncertainties.
- Comparing to many experimental measurements helps refine theoretical methods and may exhibit hints of physics beyond the Standard Model.

Experimental Techniques in Charmless B Decays

- Data sets $\sim 500 fb^{-1} \sim 500 \times 10^6 B\bar{B}$ pairs
- Access branching fractions: $\mathcal{B} \sim 10^{-5} - 10^{-7}$
- Dominant backgrounds from $e^+e^- \rightarrow q\bar{q}$ where $q = u, d, s, c$
 - Discriminate against with event shape (Fisher, Neural Net, etc.)

- Extract signals using Maximum Likelihood (ML) Fit using several variables:

- $\Delta E = E_{meas} - E_{beam}$ ~ 0
- $m_{ES} = \sqrt{E_{beam}^2 - p_{meas}^2}$ $\sim m_B$
- Event shape
- Resonance masses & helicities

signal

Signal

Background

- $M_{bc} = m_{ES}$ used by Belle

Experimental Results from 2010

BABAR

™ and © Nihara, All Rights Reserved

- $B \rightarrow \eta' \rho, \eta' f_0, \text{ and } \eta' K^*, \text{ where } K^* = K^*(892), K_2^*(1430), \text{ and } K_0^*(1430) + (K\pi) S\text{-wave}$
- $B^+ \rightarrow a_1^+(1260) K^{*0}(892)$
- Inclusive $B^0 \rightarrow K_S^0 K^\pm \pi^\mp$
- Inclusive $B^+ \rightarrow K^+ \pi^0 \pi^0$

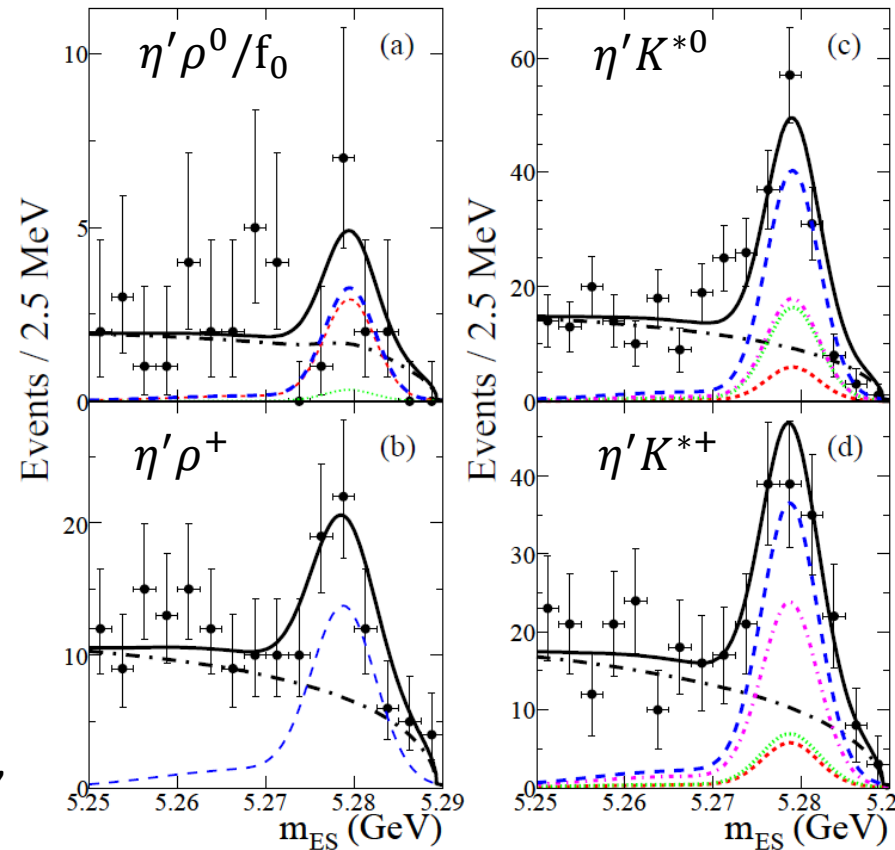

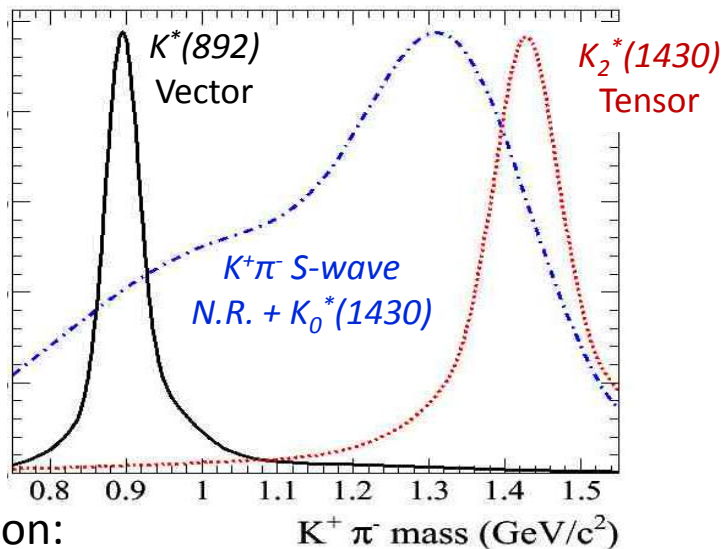

- $B^0 \rightarrow K^{*0} \overline{K^{*0}}, K^{*0} K^{*0}, K^+ \pi^- K^\mp \pi^\pm$
- $B_S^0 \rightarrow hh \text{ (} h = K^+, K^0, \pi^+ \text{)}$

B decays to $\eta' \rho$, $\eta' f_0$, and $\eta' K^*$

Data used: 424 fb^{-1}

arXiv:1004.0240 [hep-ex]
Phys. Rev. D82, 011502 (2010)

Motivation:

- Confirm predicted η/η' mixing
- Poor agreement between previous BaBar & Belle measurements (see next slide)
- Theoretical predictions from pQCD, QCDF, SCET, and SU(3) flavor symmetry
- Few predictions with K_0^* or K_2^*

Results:

- ML fit of 6 variables
- Simultaneously fit 3 K^* resonances and ρ^0/f_0
- Observe $> 5\sigma$ signals in 4 channels

B decays to $\eta' \rho$, $\eta' f_0$, and $\eta' K^*$

Phys. Rev. D82, 011502 (2010)

Theoretical Expectations:

- $\mathcal{B}[\eta' \rho^0] \sim 10^{-8} - 10^{-7}$
- $\mathcal{B}[\eta' \rho^+] \sim 0.4 \times 10^{-6}$ (SCET)
 $\sim (6 - 9) \times 10^{-6}$ (pQCD, QCDF)
- $\mathcal{B}[\eta' K^*] \sim \text{few} \times 10^{-6}$

Dominance of $\eta' K_2^*$ over $\eta' K^*$
 not anticipated by theory.
 (Pattern seen in ωK^* but not ηK^*)

★ = 1st observation

Mode	BaBar			Belle*
	σ	BF(10^{-6})	UL(10^{-6})	Belle(10^{-6})
$\eta' \rho^0$	2.0	1.5 ± 0.9	< 2.8	< 1.3
★ $\eta' \rho^+$	5.8	9.7 ± 2.2	---	< 5.8
$\eta' K^*(892)^0$	4.0	3.1 ± 0.9	< 4.4	< 2.6
$\eta' K^*(892)^+$	3.8	4.8 ± 1.7	< 7.2	< 2.9

BaBar-Belle agreement remains poor
 BaBar favors pQCD/QCDF over SCET

BaBar-Belle agreement shaky,
 but need more data

*Phys. Rev. D75, 092002 (2007); 535M $B\bar{B}$

$$B^0 \rightarrow K^{*0} \overline{K^{*0}}, K^{*0} K^{*0}, K^+ \pi^- K^{\mp} \pi^{\pm}$$

Data used: 657 fb^{-1}

arXiv:1001.4595 [hep-ex]
Phys. Rev. D81, 071101 (2010)

Motivation:

- decay dominated by $b \rightarrow d$ penguin
 - Expect $\text{BF}(B^0 \rightarrow K^{*0} \overline{K^{*0}}) \sim 10^{-7} - 10^{-6}$
- If observe SM-suppressed $K^{*0} K^{*0} \rightarrow \text{NP}$
 - Expect $\text{BF}(B^0 \rightarrow K^{*0} K^{*0}) \sim 10^{-15}$
- Want to measure $K^{*0} \overline{K^{*0}}$ polarization to help understand the $B \rightarrow VV$ polarization puzzle

Results:

- K^{*0} is either $K^*(892)^0$ or $K_0^*(1430)^0$
- No signal observed
- Set **90% CL UL** $< (0.2 - 72) \times 10^{-6}$

Mode	BaBar* BF(10^{-6})	Belle BF(10^{-6})
$K^{*0} \overline{K^{*0}}$	1.28 ± 0.34	< 0.8
$K^{*0} K^{*0}$	< 0.41	< 0.2

* Phys. Rev. Lett. 100, 081801 (2008)

Search for $B^+ \rightarrow a_1^+(1260)K^{*0}(892)$

arXiv:1007.2732v1 [hep-ex]

Data used: 424 fb^{-1}

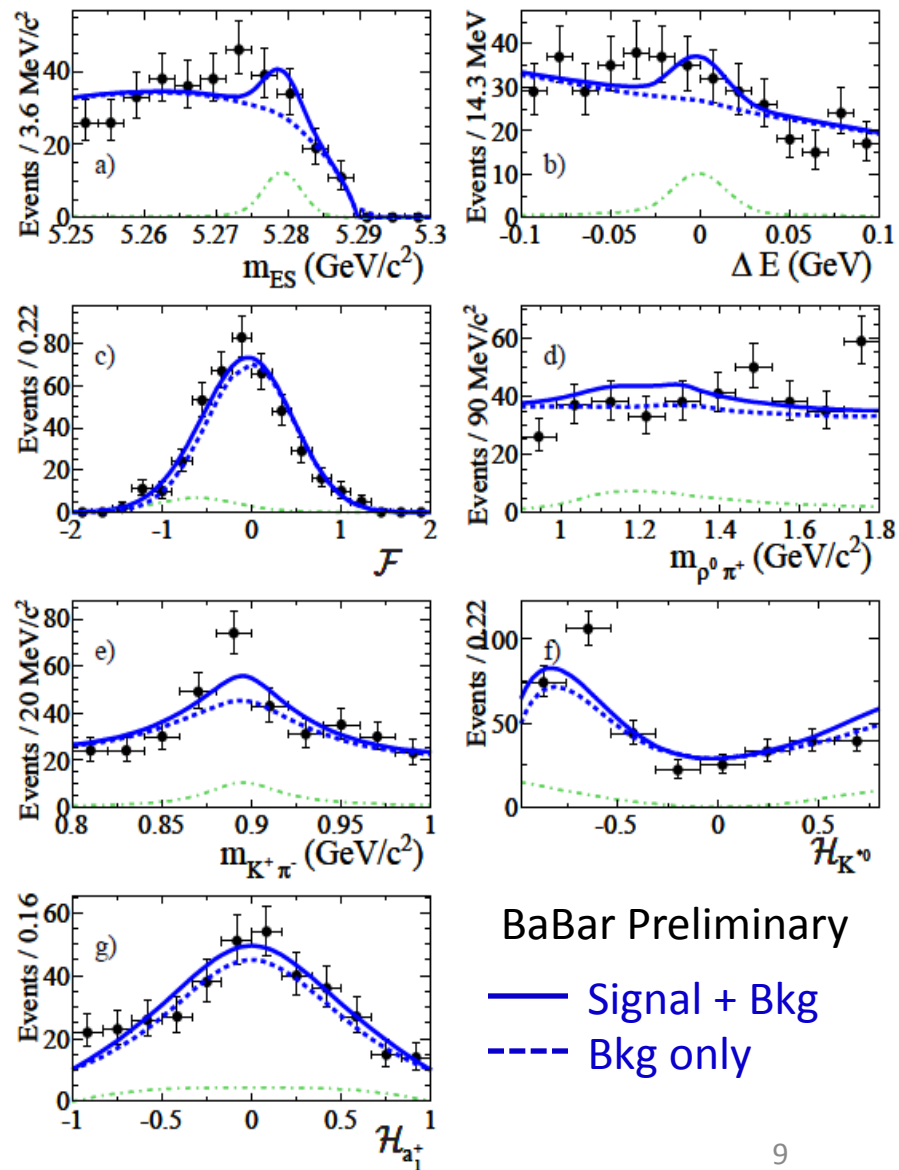

Motivation:

- Axial vector ($J^P = 1^+$) meson $a_1(1260)$
- measuring $B \rightarrow AV$ or AP will help better understand contributing amplitudes & helicity structure of charmless modes
- Predict $\mathcal{B}[B^+ \rightarrow a_1^+(1260)K^{*0}]$
 - QCDF: $(11_{-4}^{+6} \text{ } _{-9}^{+32}) \times 10^{-6}$
 - NF: $\sim 0.5 \times 10^{-6}$

Results:

- ML fit with 7 variables
- No significant signal observed (0.5σ)
- Set 90% CL UL

$$\mathcal{B}[B^+ \rightarrow a_1^+ K^{*0}] < 3.6 \times 10^{-6}$$
- Assumes $\mathcal{B}[a_1^+ \rightarrow \pi^+ \pi^- \pi^+] = 50\%$
- Favors NF; still consistent with QCDF

BaBar Preliminary

— Signal + Bkg

- - - Bkg only

Observation of $B^0 \rightarrow K_S^0 K^\pm \pi^\mp$

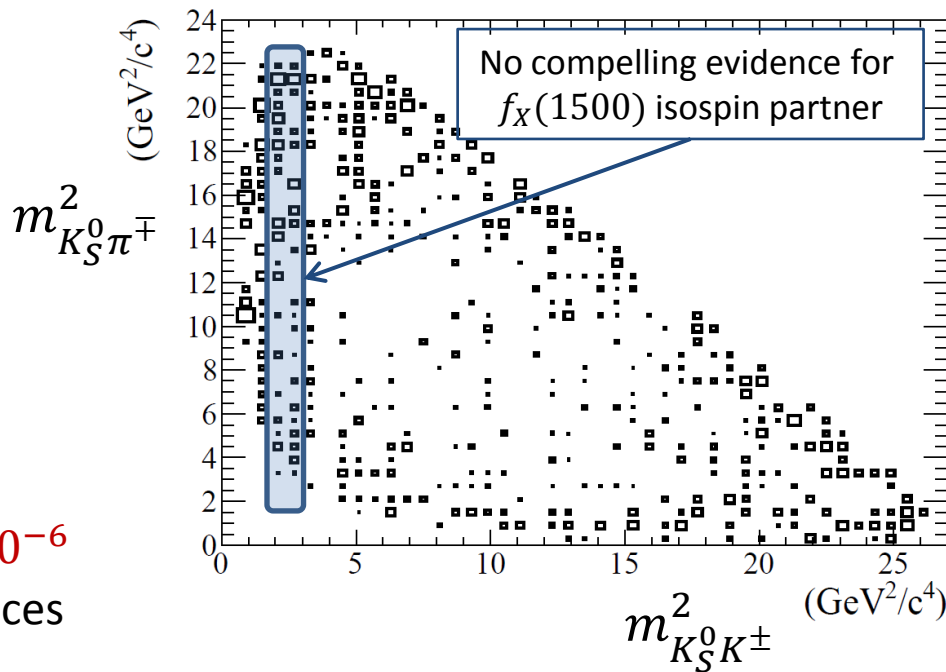

arXiv:1003.0640 [hep-ex]

Phys. Rev. D 82, 031101 (2010)

Data used: 424 fb^{-1}

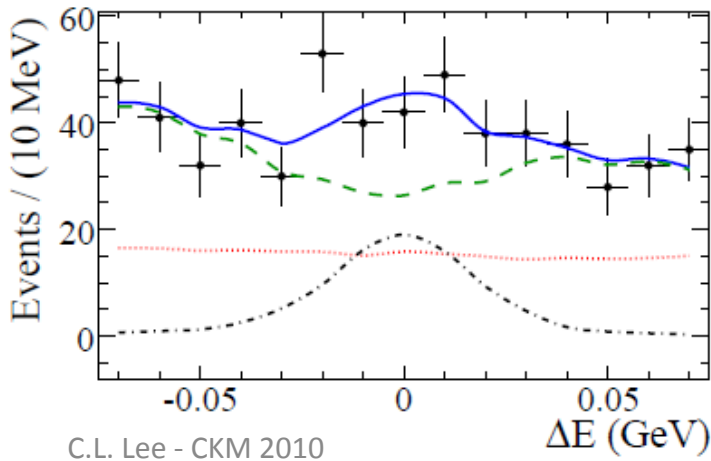

Motivation:

- $b \rightarrow d$ penguin (NP?) & $b \rightarrow u$ tree
- Isospin partner to $f_X(1500)$?
 - Peak in K^+K^- spectrum of $B^+ \rightarrow K^+K^-\pi^+$
 - Not observed in $B^+ \rightarrow K_S^0 K_S^0 \pi^+$

Results:

- ML fit of m_{ES} , ΔE , Fisher
- 5.2σ observation
- $\mathcal{B}[B^0 \rightarrow K_S^0 K^\pm \pi^\mp] = (3.2 \pm 0.5 \pm 0.3) \times 10^{-6}$
- s Plot of DP to qualitatively look for resonances

 - - - Bkg only
 . . . Signal only

$$B_S^0 \rightarrow hh \quad (h = K^+, K^0, \pi^+)$$

arXiv:1006.5115 [hep-ex]

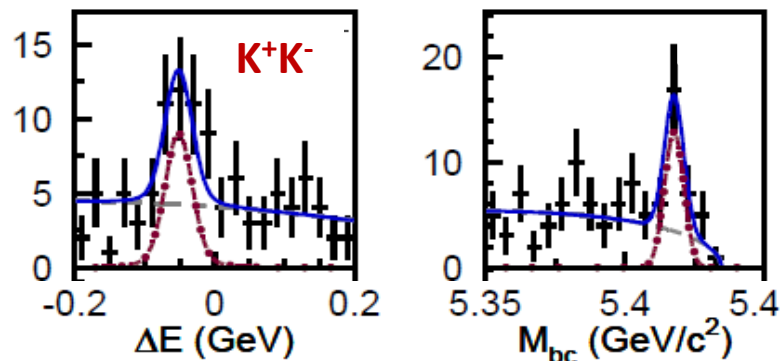

Data used: $1.25M B_S^{(*)} \bar{B}_S^{(*)}$ pairs at $\Upsilon(5S)$, 23.6 fb^{-1}

Motivation:

- Help understand the $K\pi$ Puzzle in B_d decays
- NP comparing A_{CP} in B_s and B_d decays?

Results:

- ML fit with m_{ES} & ΔE
- 5.8σ measurement of $B_S^0 \rightarrow K^+ K^-$
- Compatible with CDF measurements
 - See Tuesday talk by M. Dorigo

Theory/Future Experimental Effort:

arXiv:1002.4518 [hep-ph], G. Zhu

- In QCDF, “tree” amplitude can be well estimated, but result gives too low a BF for $B_S^0 \rightarrow K^+ \pi^-$.
- Could solve with larger $B_S \rightarrow K$ form factor, or if charming penguins are not small.
- To differentiate, investigate ratio:

$$\frac{\mathcal{B}[B_S \rightarrow \rho^+ K^-]}{\mathcal{B}[B_S \rightarrow \pi^+ K^-]} = 2.5 \pm 0.2 \text{ (in QCDF)}$$

Mode	Belle BF (10^{-6})	CDF* BF (10^{-6})
$K^+ K^-$	38 ± 12	24 ± 5
$K^+ \pi^-$	< 26	5.0 ± 1.1
$\pi^+ \pi^-$	< 12	< 1.2
$K^0 \bar{K}^0$	< 66	---

* arXiv:hep-ex/0612018 and Phys. Rev. Lett. 103, 031801 (2009)

Search for Inclusive $B^+ \rightarrow K^+ \pi^0 \pi^0$

arXiv:1005.3717 [hep-ex]

Data used: 429 fb^{-1}

Motivation:

- Understanding $K^* \pi$ may shed light on the $K \pi$ puzzle
- $B^+ \rightarrow K^{*+} \pi^0$ poorly measured; 3 body state previously not investigated
- DP studies of $K \pi \pi$ show presence of $f_X(1300)$ in $\pi^+ \pi^-$. Finding it in $\pi^0 \pi^0$ would suggest spin-even.
- May help interpret TD CP results in $K_S^0 \pi^0 \pi^0$ ($b \rightarrow s$ penguin measures β/ϕ_1)

Results:

- 2D ML fit with m_{ES} & Event Shape (NN)
 - Cut on ΔE (correlated with DP resolution)
- Observe with significance $> 10\sigma$

$$\mathcal{B}[B^+ \rightarrow K^+ \pi^0 \pi^0] = (15.5 \pm 1.1 \pm 1.6) \times 10^{-6}$$

Summary & Outlook

- BaBar & Belle continue to make interesting measurements of charmless hadronic B decays.
- \mathcal{B} , A_{CP} , and f_L measurements challenge & test theoretical methods.
- Super B factories will...
 - access SM-suppressed processes,
 - allow for more precise measurements of \mathcal{B} , A_{CP} , and f_L to further challenge theoretical calculations,
 - enable measurements impossible with current data sets (ie. TD analyses & full angular analyses) that give further insight into decay dynamics.
- Current measurements already map out an impressive landscape of charmless B decays...

Puzzles in Charmless B Decays

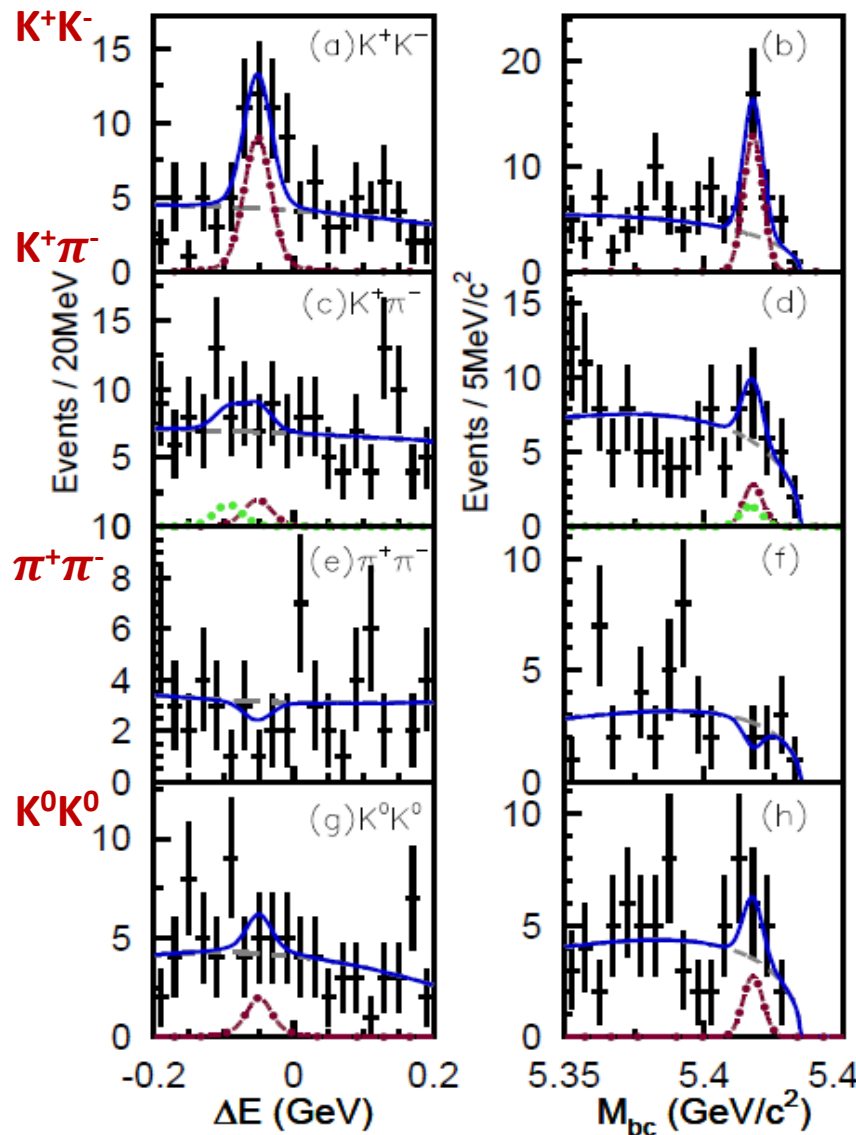

- Theory & experiment are generally in good agreement.
- Some puzzles remain.
 - many were discussed in dedicated sessions at CKM 2010.
- $K\pi$ CP puzzle:
 - Naively expect A_{CP} to be equal for $B^+ \rightarrow K^+\pi^0$ and $B^0 \rightarrow K^+\pi^-$. They differ by $\sim 5\sigma$.
- Large rates for $B \rightarrow \eta'K$ but not $B \rightarrow \eta K$
 - Qualitatively understood, but predictions still not great.
- Predicted B for $B \rightarrow \pi^0\pi^0, \rho^0\pi^0$ are too small.
- Polarization puzzle:
 - Longitudinal polarization fraction (f_L) of penguin-dominated $B \rightarrow VV$ decays is smaller than naively anticipated.
