

***Measurement of
 $B \rightarrow D^{(*)} \ell \nu$ Decays
and Status
of $B \rightarrow D^{**} (D^{(*)} n \pi) \ell \nu$***

David Lopes Pegna (Princeton University)

*CKM Workshop, Warwick, UK
9 September 2010*

Exclusive $B \rightarrow D(^*)\ell\nu$

$$\frac{d\Gamma}{dw}(\bar{B} \rightarrow D^* \ell \bar{\nu}_\ell) = \frac{G_F^2}{48\pi^3} |V_{cb}|^2 m_{D^*}^3 (w^2 - 1)^{1/2} P(w) (\mathcal{F}(w))^2$$

$$\frac{d\Gamma}{dw}(\bar{B} \rightarrow D \ell \bar{\nu}_\ell) = \frac{G_F^2}{48\pi^3} |V_{cb}|^2 (m_B + m_D)^2 m_D^3 (w^2 - 1)^{3/2} (\mathcal{G}(w))^2$$

$w \equiv v \cdot v'$

form factor

- ◆ The $F(w)$ and $G(w)$ form factors can be parameterized based on HQET and dispersion relations (Caprini et al, Nucl.Phys. B530, 153 (1998))
- ◆ Form-factor parameters are ρ^2, R_2, R_2 (ρ^2) for $D^*(D)$
- ◆ $F(1)$ and $G(1)$ from lattice QCD
- ◆ Experiments fit the FF parameterization over nearly the entire phase space
- ◆ Up to now, $B \rightarrow D^* \ell \nu$ uncertainty dominated by theory error (lattice), $B \rightarrow D \ell \nu$ by experimental uncertainty

$F(1) = 0.921 \pm 0.013 \pm 0.020$	C. Bernard et al. [Phys.Rev.D79, 014506 (2009)]
$G(1) = 1.074 \pm 0.018 \pm 0.016$	M. Okamoto et al. [Nucl.Phys.Proc.Suppl. 140, 461 (2005)]

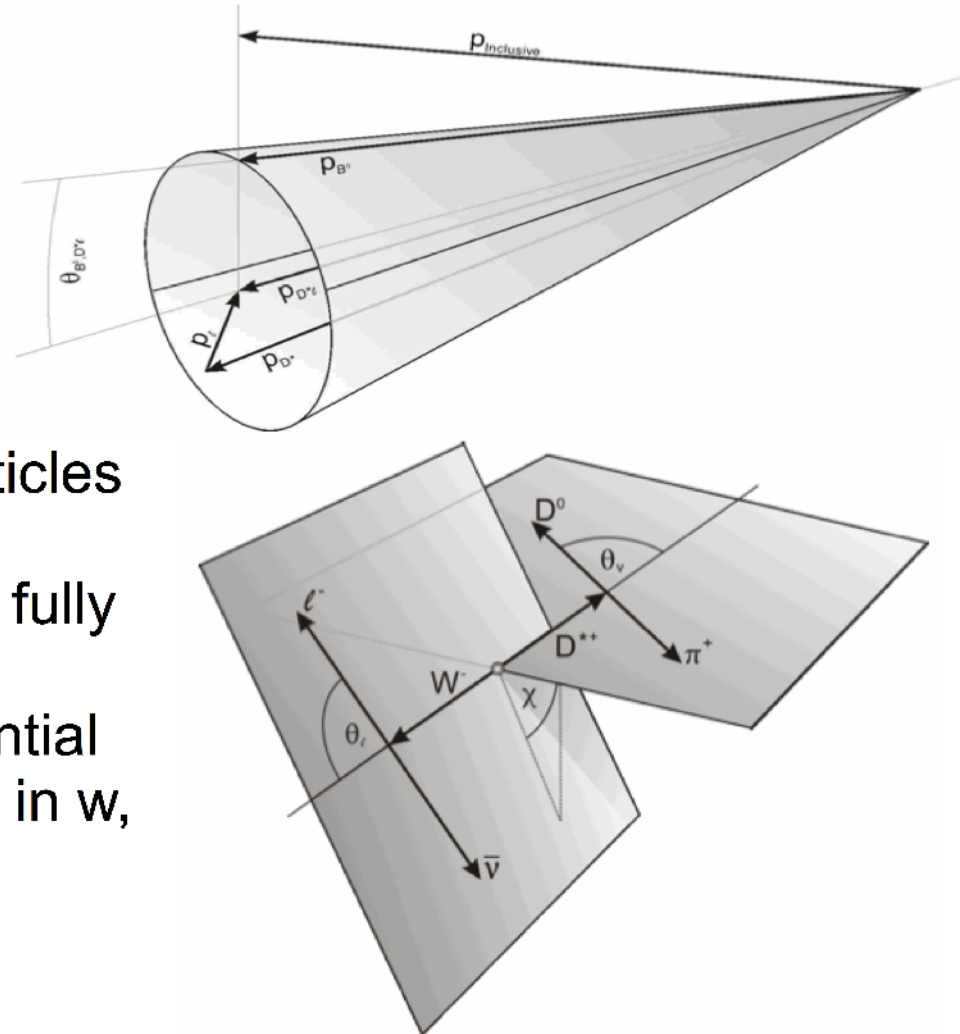

$B \rightarrow D^* \ell \nu$ Recent Results

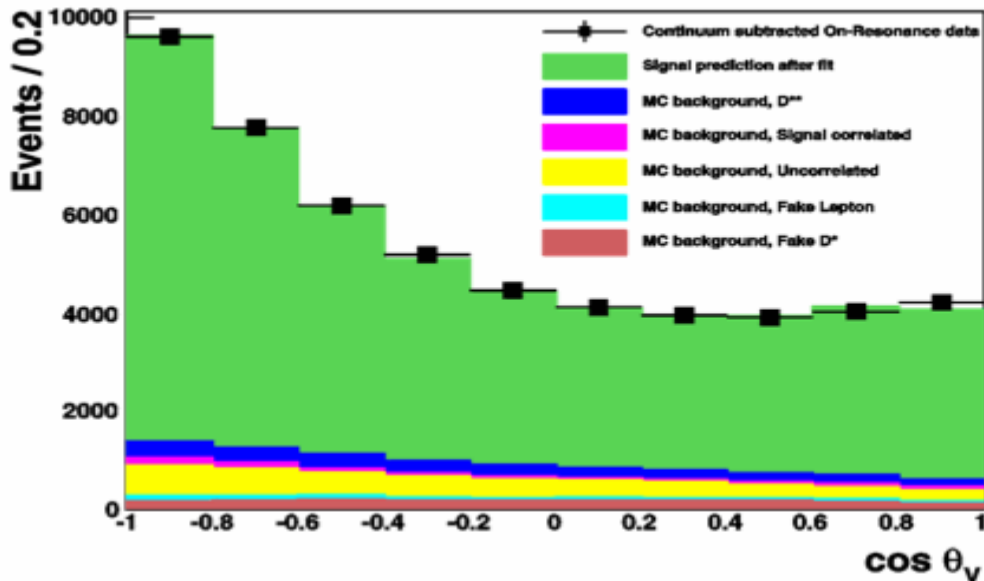

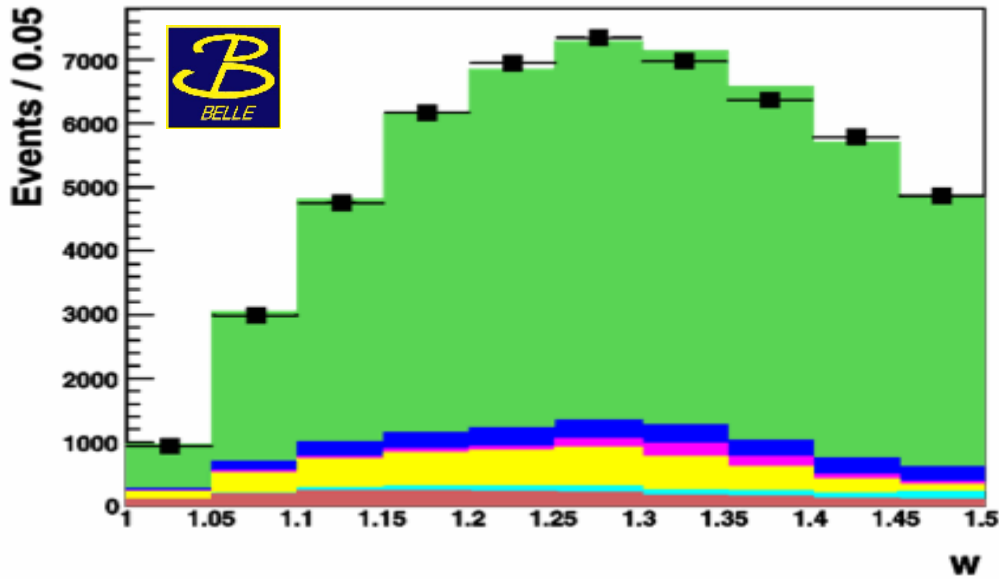

ICHEP 2010 [arXiv:0810.1657] preliminary

[arXiv:0910.3534] preliminary

- ◆ Untagged analysis of $B^0 \rightarrow D^{*+} \ell \nu$ based on 711 fb^{-1} ($B^+ : 140 \text{ fb}^{-1}$),
- ◆ Reconstruct $D^{*+} \rightarrow D^0 \pi^+$, $D^0 \rightarrow K \pi$ ($B^+ : D^{*0} \rightarrow D^0 \pi^0$, also $D^0 \rightarrow K 3 \pi$)
- ◆ Reconstruct B momentum using kinematics and the remaining particles in the event
- ◆ Calculate w and three angles that fully describe the decay
- ◆ Fit these 4 variables to the differential width (binned fit to the projections in w , $\cos \theta_\ell$, $\cos \theta_\nu$ and χ)

$B \rightarrow D^* \ell \nu$ Recent Results

$B \rightarrow D^* \ell \nu$ Recent Results

- ◆ Differences between the 2 Belle analysis:
- ◆ Data sample ($140\text{fb}^{-1} \rightarrow 711\text{fb}^{-1}$), D^0 modes ($K\pi, K3\pi$ vs $K\pi$ only)
- ◆ Enhanced background calibration
- ◆ Soft π investigation
- ◆ Newer PDG numbers for D branching ratios etc.

$B \rightarrow D^* \ell \nu$: HFAG Averages

$B \rightarrow D^* \ell \nu$ Comments

- Can we still improve the sensitivity for $B \rightarrow D^* \ell \nu$?
(In)-famous HFAG puzzle on the $|V_{cb}|$ average
- More disturbing, at least for the Branching Fractions, is the tagged-untagged disagreement:
Belle untagged: $\text{BF}(D^{*+} \ell \nu) = (4.6 \pm 0.3)\%$, $\text{BF}(D^{*0} \ell \nu) = (4.8 \pm 0.6)\%$
BaBar untagged: $\text{BF}(D^{*+} \ell \nu) = (5.1 \pm 0.2)\%$, $\text{BF}(D^{*0} \ell \nu) = (5.5 \pm 0.2)\%$
BaBar tagged: $\text{BF}(D^{*+} \ell \nu) = (5.4 \pm 0.3)\%$, $\text{BF}(D^{*0} \ell \nu) = (5.8 \pm 0.3)\%$
- Connected to the incl - excl BF puzzle (see later)
- BaBar $|V_{ub}|$ analysis on tagged samples clearly favors higher BF ($>5\%$) for $B \rightarrow D^* \ell \nu$
- It would be important to get an update on the tagged samples from Belle (e.g. Belle Phys. Rev. D 72, 051109 (2005), $\text{BF}(D^{*0} \ell \nu) = (6.1 \pm 0.3)\%$)

$B \rightarrow D \ell \nu$ Recent Results

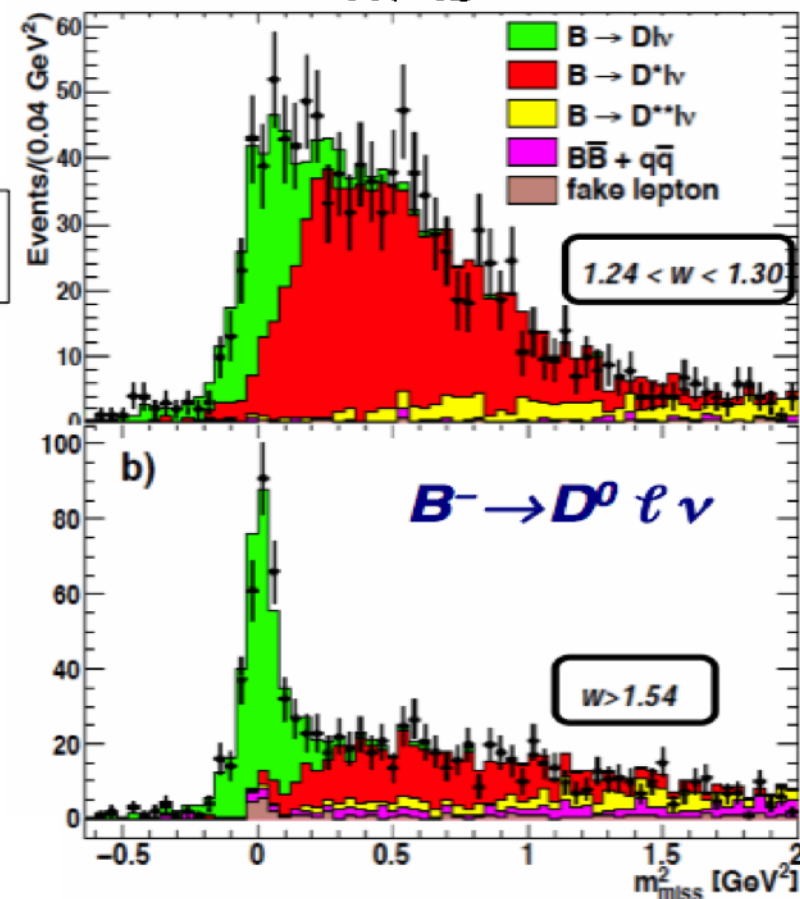

- ◆ Hadronic tag:
 - Reduced background (higher S/N)
 - Fully exploit kinematic constraints (w resolution ~ 0.01)
 - Avoid neutrino reconstruction
- ◆ Identify semileptonic B decays through the missing mass squared in the event:

$$m_{\text{miss}}^2 = [p(\Upsilon(4S)) - p(B_{\text{tag}}) - p(D) - p(\ell)]^2$$

- ◆ Binned maximum likelihood fit, MC shapes to different signal and background components
- ◆ Inclusive $B \rightarrow X \ell \nu$ used as normalization

Phys.Rev.Lett.
104:011802,2010

417 fb⁻¹

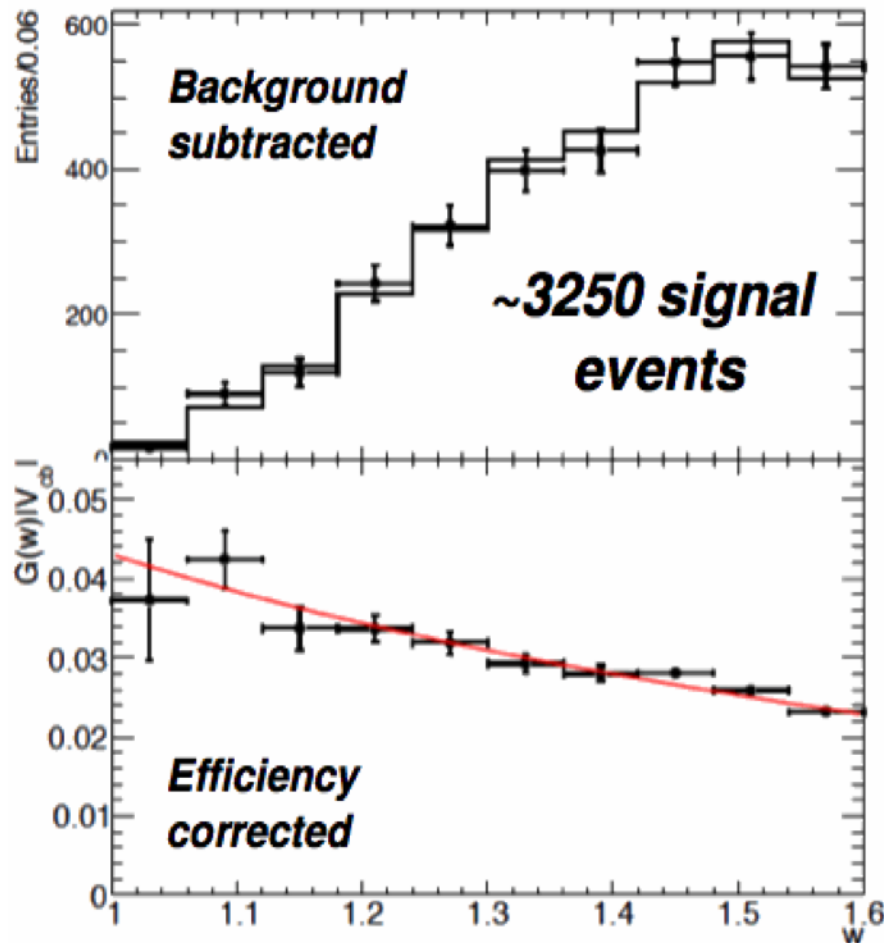

$B \rightarrow D\ell\nu$ Recent Results

Extract w spectrum by fitting $m_{2\text{miss}}$ in 10 w bins

χ^2 fit to w spectrum to measure $G(1)|V_{cb}|$ and ρ^2 , reweighting MC template

$$G(1)|V_{cb}| = (42.3 \pm 1.9 \pm 1.4) \times 10^{-3}$$

$$\rho^2 = 1.20 \pm 0.09 \pm 0.04$$

$$Br(B^0 \rightarrow D\ell\nu) = (2.15 \pm 0.06 \pm 0.07)\%$$

Normalization of the FF at $w=1$ available in quenched and unquenched (2+1) calculations
 Computation of $G(w)$ at $w>1$ start to be available
 Tantaló et al. (PLB655,45 (2007)) with quenched approximation, and more recently T. Mannel et al. (arXiv:0809.0222) using LCSR

w	$G(w)$		
1.00	1.074 ± 0.024	unquenched	LAT05 (Okamoto) ←
1.00	1.058 ± 0.020	quenched	PRD61,014502 (2005)
1.00	1.026 ± 0.017	quenched	PLB655, 45 2007
1.03	1.001 ± 0.019	"	"
1.05	0.987 ± 0.015	"	"
1.10	0.943 ± 0.011	"	"
1.20	0.853 ± 0.021	"	"
w_{max}	0.61 ± 0.16	LCSR	arXiv.0809.0222 (2008)

B → D_s Recent Results

Reduce the model dependence determining $G(w')|V_{cb}|$ from a fit in a limited region of phase-space

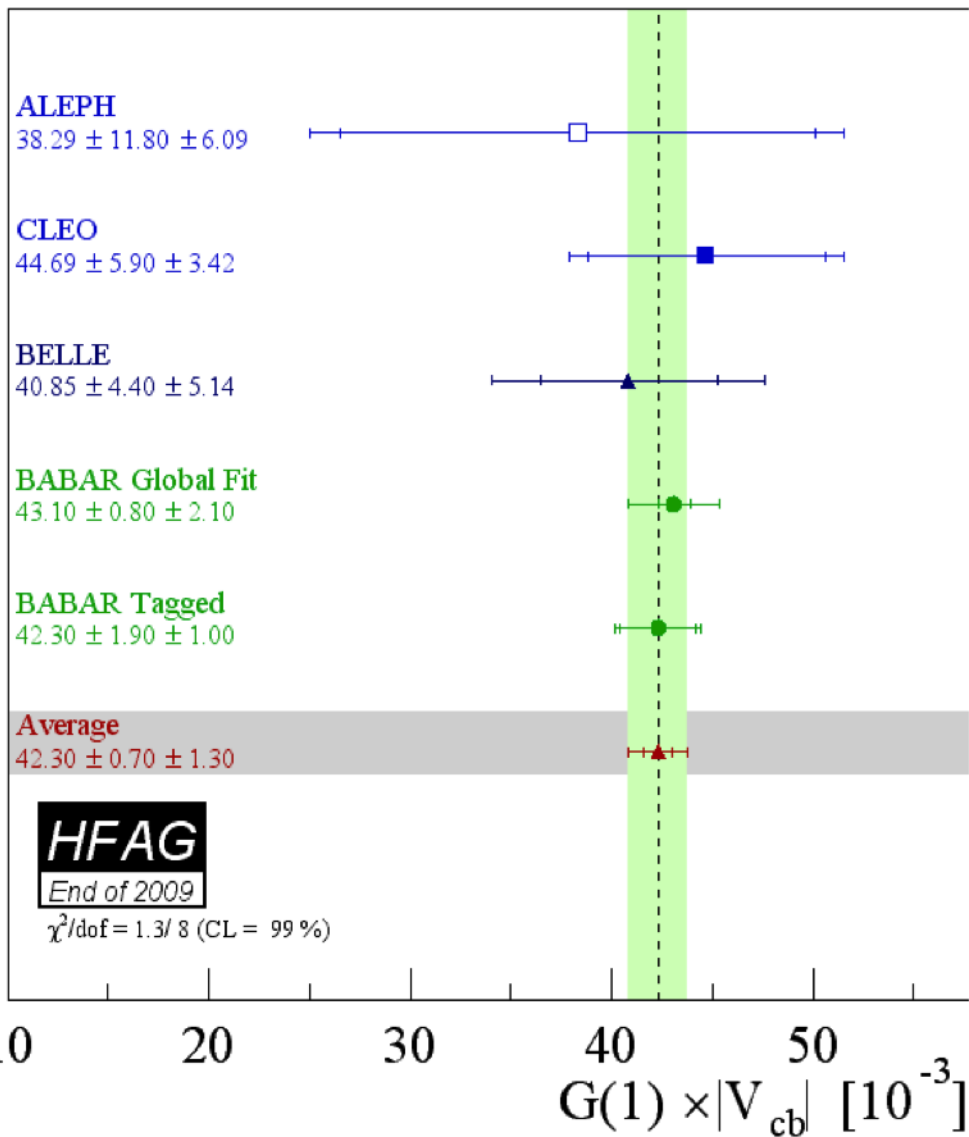

w'	$ V_{cb} G(w')/G(w') \cdot 10^{-3}$	
unquenched (FNAL)		
1.00	$39.2 \pm 1.8 \pm 1.3 \pm 0.9$	Full PS
quenched (Tantalo)		
1.00	$40.9 \pm 1.8 \pm 1.3 \pm 0.7$	4 bins
1.03	$40.2 \pm 5.6 \pm 1.3 \pm 0.8$	
1.05	$40.0 \pm 5.0 \pm 1.4 \pm 0.6$	
1.10	$40.0 \pm 3.4 \pm 1.4 \pm 0.5$	
1.20	$40.7 \pm 1.3 \pm 1.4 \pm 1.0$	4 bins
	stat syst FF	

Experimental error interpolating 4 bins around $w=1.2$ is competitive with the extrapolation to $w=1$ using the full phase-space

We expect lattice community provide un-quenched (2+1) computation of the FF at $w=1$ and at $w>1$

$B \rightarrow D \ell \nu$: HFAG Averages

$B \rightarrow D(*)\ell\nu$ Uncertainty

$B \rightarrow D^*\ell\nu$	Untagged	Tagged
Yield	$\sim 10^5$	$\sim 10^3$
Measured	BF, ρ^2 , $ V_{cb} $, R_1, R_2	BF
Uncertainty	4% (BF), $\sim 3\%$ (FF)	5% (BF)
$B \rightarrow D\ell\nu$		
Yield	$\sim 10^4$	$\sim 10^3$
Measured	BF, ρ^2 , $ V_{cb} $	BF, ρ^2 , $ V_{cb} $
Uncertainty	5% ($ V_{cb} $) 6% (ρ^2)	5% ($ V_{cb} $), 8% (ρ^2)

$$B \rightarrow D^*\ell\nu \quad \sigma(|V_{cb}|) \sim 1.5\% \oplus 2.6\%$$

$$B \rightarrow D\ell\nu \quad \sigma(|V_{cb}|) \sim 3.5\% \oplus 2.2\% \text{ (unquenched)}$$

$$1.7\% \text{ (quenched)}$$

$B \rightarrow D(*)\ell\nu$ Future (2011)

◆ $B \rightarrow D^*\ell\nu$

Can untagged analysis reduce the uncertainties?

→ Still, 4-d $B \rightarrow D^*\ell\nu$ on BaBar full dataset highly desirable

Can tagged analysis measure FF? Tough, need very high statistics

→ new tagged analysis from Babar (new tag, 2.5-3x more efficient) will attempt it

◆ $B \rightarrow D\ell\nu$

→ Untagged analysis on full dataset necessary from BaBar and Belle

→ new tagged analysis from BaBar expected

(personal) Claim: $|V_{cb}|$ from $B \rightarrow D\ell\nu$ can go down to $\sim 1.5\text{-}2\%$

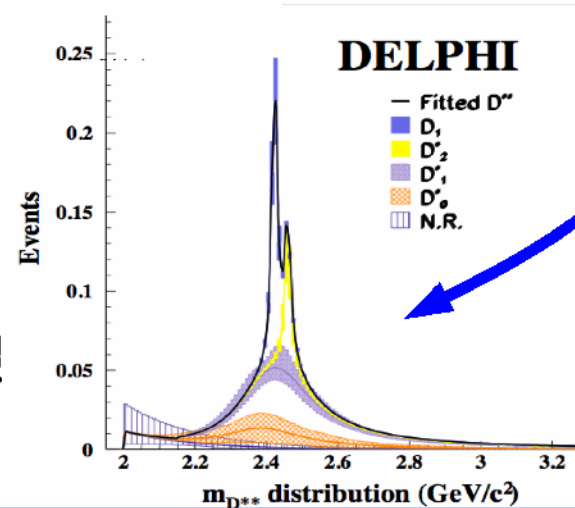

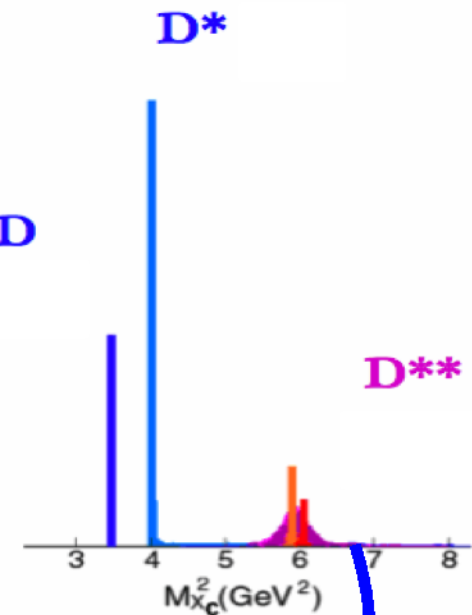

The X_c System in $B \rightarrow X_c \ell \nu$ Decays

$$BR(B \rightarrow X_c \ell \nu) \sim 10.5\%$$

- In addition to the “well” measured $D^{(*)}$ states, there are the D^{**} states, orbital excitations of the D-mesons
- Heavy Quark Symmetry predicts 4 D^{**} states, 2 narrow and 2 broad, all observed in hadronic decays
- The naïve assumption $X_c = D + D^* + D^{**}$ is contradicted

by the experiments that show a 10-15% difference (or more!!!) between direct measurements of the inclusive $X_c \ell \nu$ rate and the sum of the $D/D^*/D^{**} \ell \nu$ rates

Spectroscopy of excited D mesons

Use D^{**} as nickname for states $D^{(*)}(n\pi)$ with $n>0$ including:

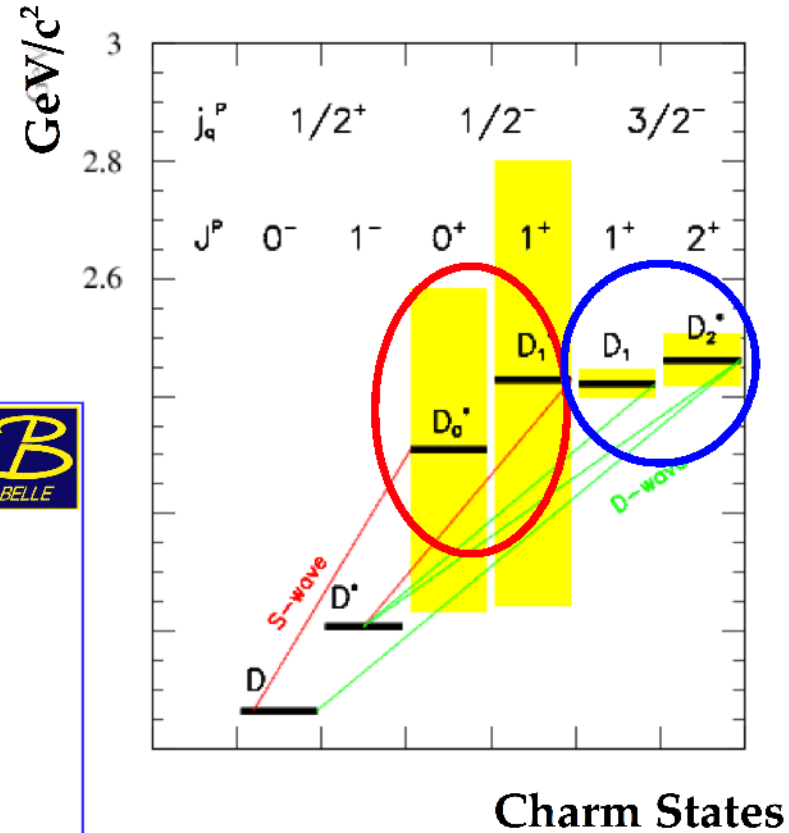

- Narrow resonances D_1, D_2^*
- Broad resonances D_0^*, D_1'
- Non-resonant?

Need help from hadronic $B \rightarrow D^{**}\pi$ to characterize D^{**} broad states

Abazov et al, PRL 95
(2005) 171803

Abe et al, PRD 69
(2004) 112002

$D^*\pi$ Invariant Mass [GeV/c^2]

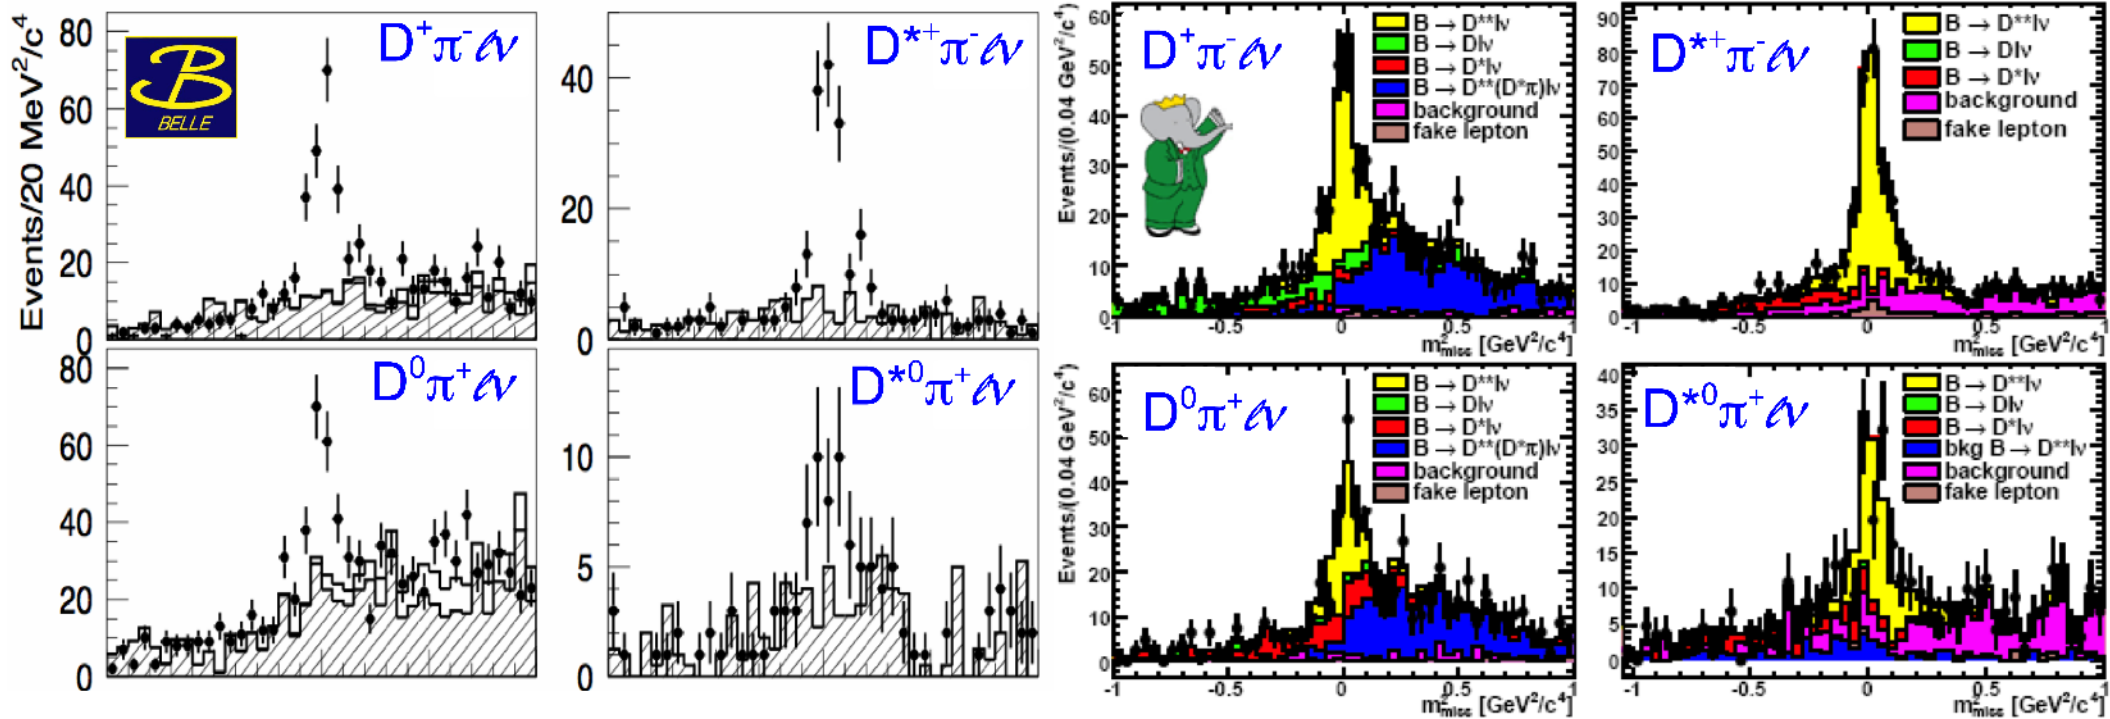

$D\pi$ Invariant Mass [GeV/c^2]

$B \rightarrow D^{(*)} \pi \ell \bar{\nu}$ Branching Fractions

605 fb⁻¹ PRD 77: 091503 (2008)

341 fb⁻¹ PRL 100: 151802 (2008)

◆ Clean samples of $B \rightarrow D^{(*)} \pi \ell \bar{\nu}$ events in both BaBar and Belle analysis, similar techniques and excellent agreement in the measurement of branching fractions

HFAG 2010

$$\mathcal{B}(B^- \rightarrow D^{(*)+} \pi \ell^- \bar{\nu}_\ell) = (1.55 \pm 0.10)\%$$

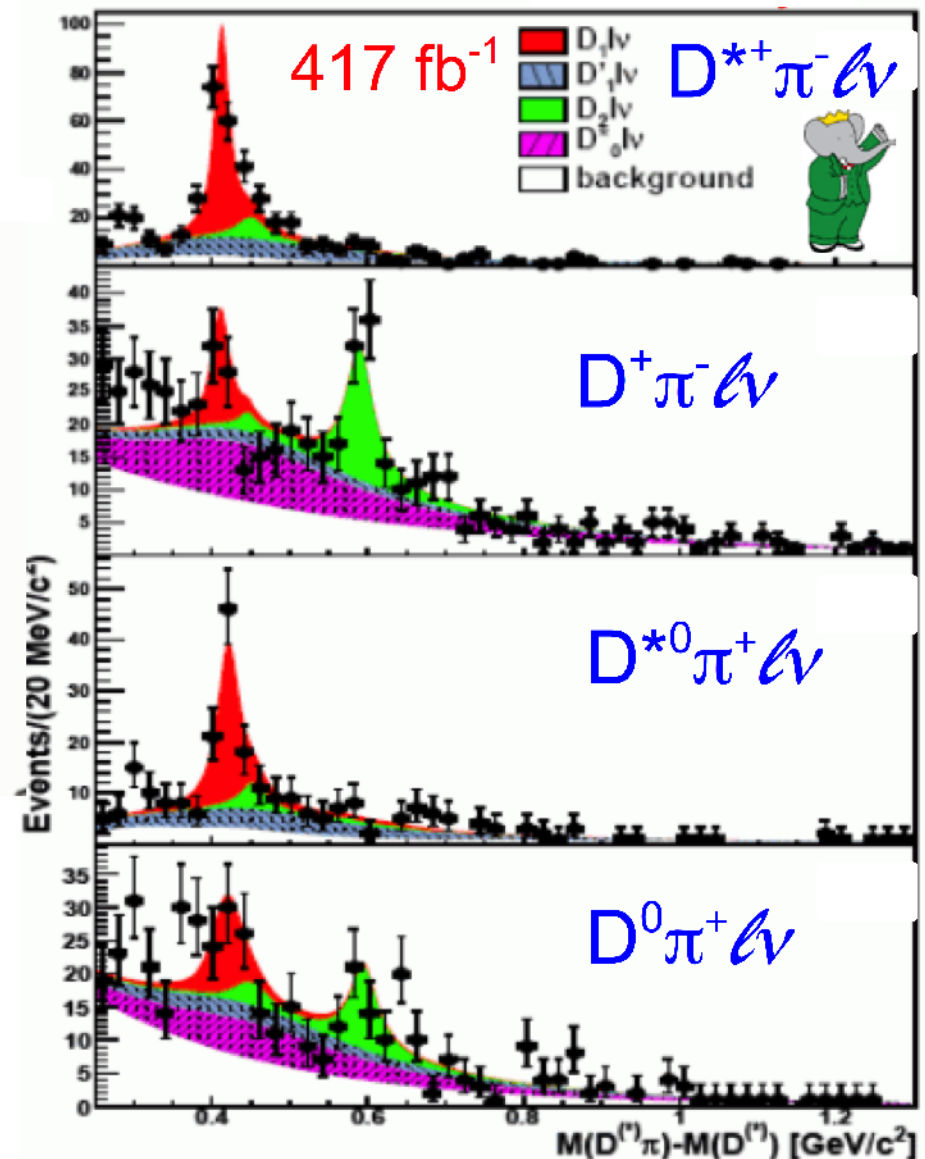

$$\mathcal{B}(\bar{B}^0 \rightarrow D^{(*)0} \pi \ell^- \bar{\nu}_\ell) = (1.38 \pm 0.14)\%$$

$B \rightarrow D^{**} \ell \nu$ (BaBar)

PRL 101,261802(2008)

- Reconstruct $B \rightarrow D^{(*)} \pi^{\pm} \ell \nu$ in events tagged by hadronic B
- Simultaneous fit to $M(D^{(*)} \pi) - M(D^{(*)})$, including cross-feed
- Background yield constrained from fit to m_{ES} , shape checked on wrong-sign data combinations
- Large rate for broad states!!

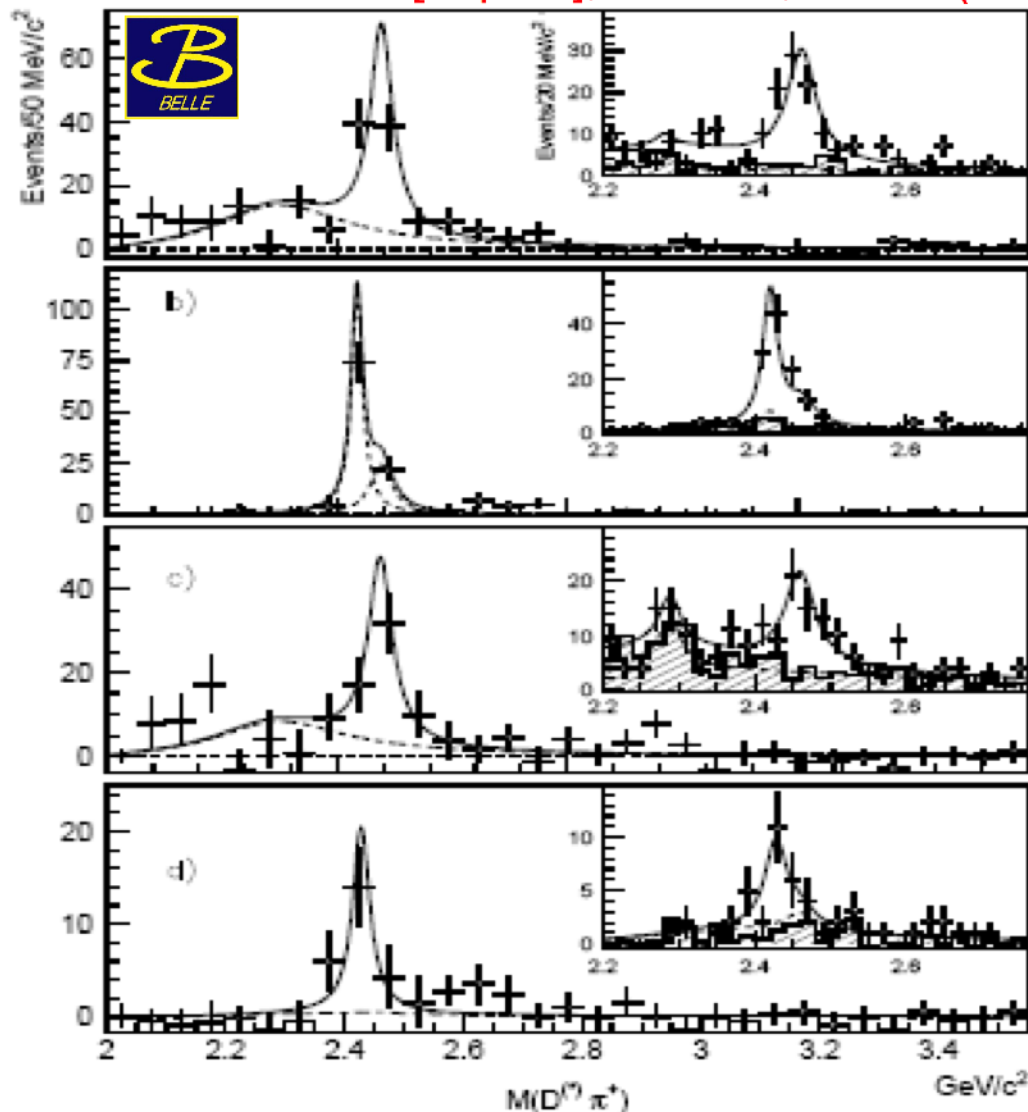

$B \rightarrow D^{**} \nu$ (Belle)

ArXiv:0711.3252 [hep-ex], PR D77,091503(2008)

605 fb⁻¹

- ◆ Hadronic tag analysis from Belle
- ◆ Similar technique to BaBar, independent fits for different final states
- ◆ Confirm signals for narrow D_{11} and D_{21} , sees only broad D_{01}^* , no D_{11}'

Comparison BaBar-Belle

- ▶ Result for the D_0^* broad state consistent between BaBar and BELLE
- ▶ BaBar observes the D_1' , not present in the BELLE data
- ▶ Narrow D^{**} results consistent with preliminary untagged BaBar results and D0 measurement (PRL 95, 171803 (2005)). PRL 103,051803(2009)

Consistency: the big Picture

$$B(B^+ \rightarrow \bar{D}_1^0 1^+ \nu) B(\bar{D}_1^0 \rightarrow D^{*-} \pi^+) [\%]$$

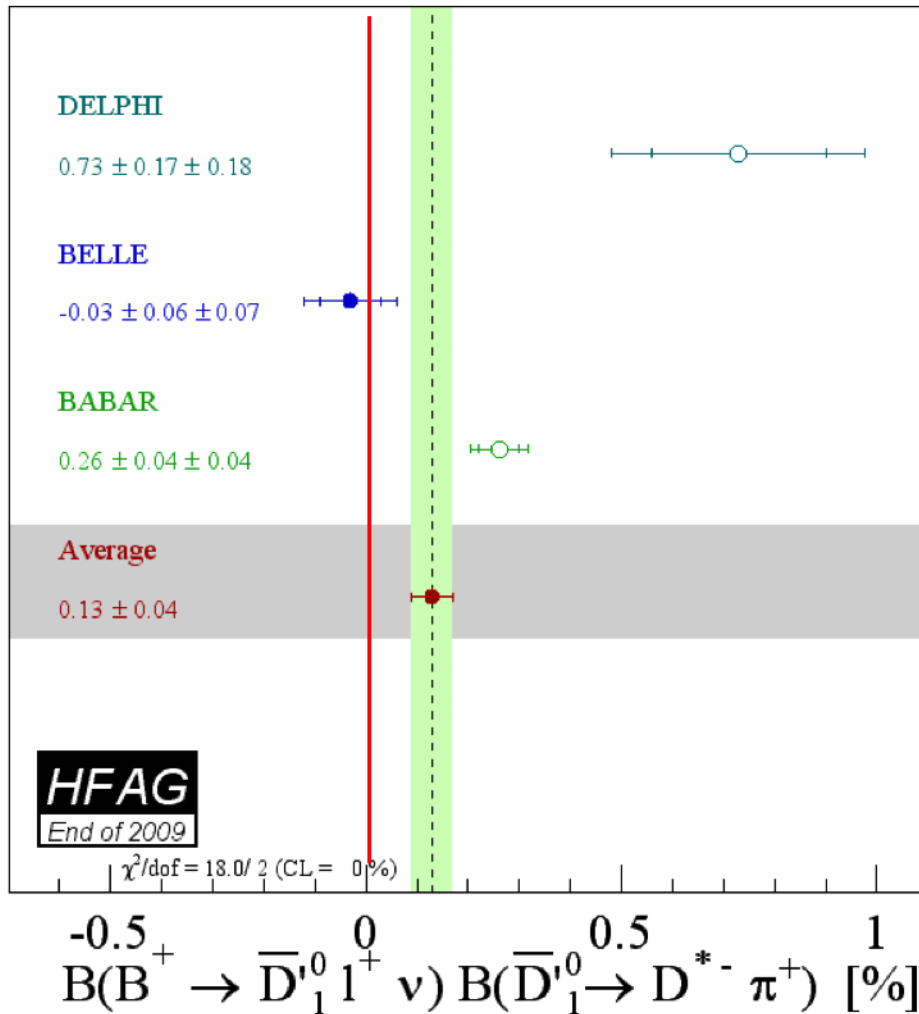

$$B(B^+ \rightarrow \bar{D}_2^0 1^+ \nu) B(\bar{D}_2^0 \rightarrow D^{*-} \pi^+) [\%]$$

Excellent agreement of the most precise measurements, in particular the tagged and untagged Babar analysis

Consistency: the big Picture

◆ Situation more complicated for the broad states.....

Comments

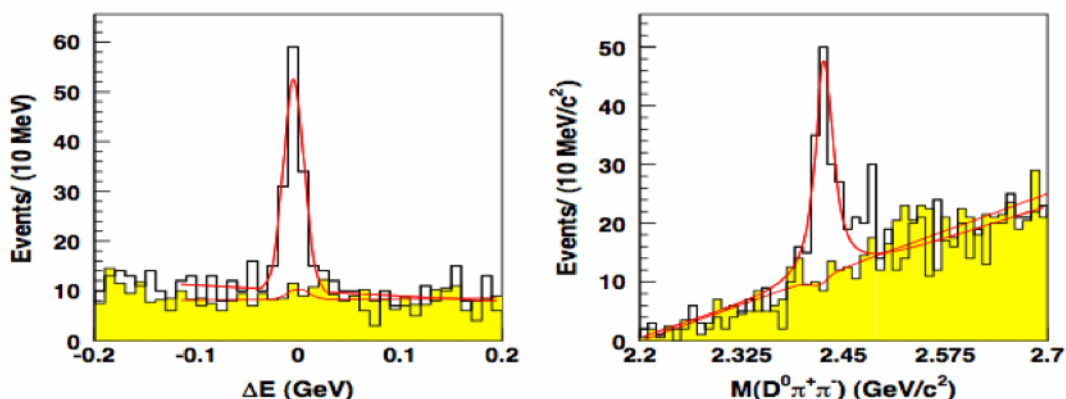

- ◆ BaBar and Belle measure $\mathcal{B}(B \rightarrow D^{(*)}\pi\ell\nu) \sim 1.5\%$
- ◆ About 0.6% of this rate is due to the narrow D_1 and D_2 states
- ◆ What is the rest?
- ◆ BaBar measures about 0.9% for the broad states
Belle agrees for the D_0^* , while it sets a very stringent upper limit for the D_1'
- ◆ We are left with 2 puzzles:
- ◆ The broad rate is in contrast with theoretical predictions (3/2 vs 1/2 puzzle, see backup)
- ◆ What is the difference between the inclusive rate and the $\Sigma \text{Excl}(D/D^*/D^{(*)}\pi\ell\nu)$?

On the Incl- Σ Excl puzzle

- ◆ The most likely candidate to fill the inclusive rate is $B \rightarrow D^{(*)}n\pi\ell\nu$, with $n > 1$:
- ◆ We have already evidence for $D^{**} \rightarrow D\pi\pi$ decays, Belle PRL 94, 221805 (2005)

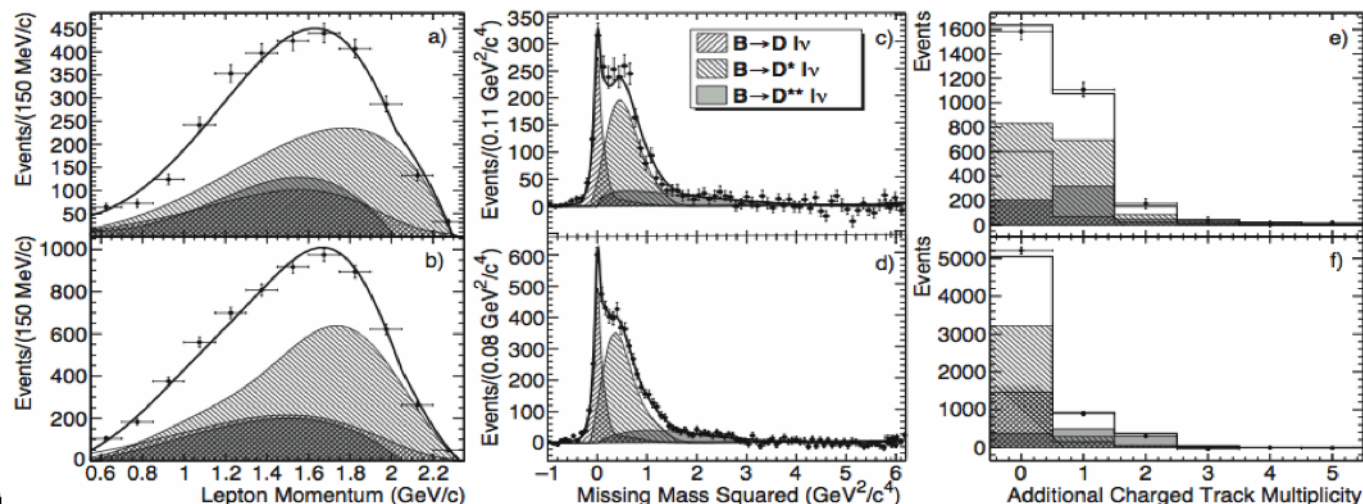

- ◆ BaBar measured the relative branching fraction

$$\mathcal{B}(B \rightarrow D^{(*)}(n\pi)\ell\nu)$$

$$\mathcal{B}(B \rightarrow DX\ell\nu) = 0.197 \pm 0.013 \pm 0.013 \pm 0.012,$$

PR D76, 051101 (2007)

On the Incl- Σ Excl puzzle

- ◆ How likely is that we will observe $B \rightarrow D^{(*)}\pi\pi\ell\nu$ decays?
- ◆ The hadronic tag is the most obvious choice
- ◆ Challenging however, high multiplicity on the SL side affects hadronic tag selection/purity
- ◆ If we assume a rate of 0.2% for $B \rightarrow D_{1,2}\ell\nu$, $D_{1,2} \rightarrow D^{(*)}\pi\pi$, we should see \sim tens of events in the full Belle dataset
- ◆ BaBar has a new hadronic tag algorithm, expect about $>2x$ improvement in signal yield w.r.t. previous BaBar tagged analysis

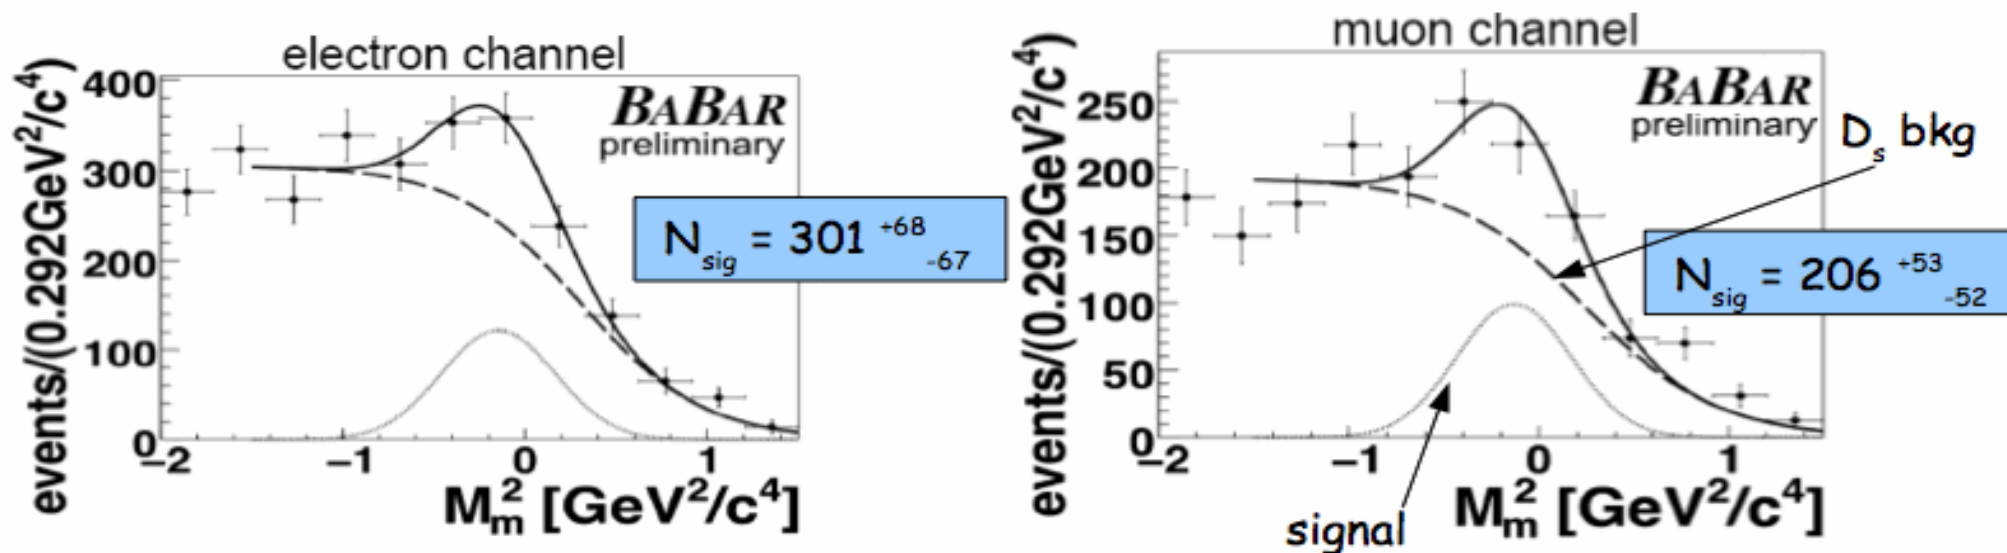

Observation of $B \rightarrow D_s K \ell \bar{\nu}$

- Signal yields extracted via unbinned extended maximum likelihood fit to Missing mass

$$M_m^2 = (E_{beam} - E_Y)^2 - |\vec{p}_Y|^2 = m_\nu^2 \quad Y = D_s K \ell \text{ candidate}$$

- leading systematic uncertainty: signal MC modelling ($\sim 3\%$ - 8% depending on channel)
- Signal MC statistics ($\sim 2\%$)

342 fb⁻¹

$$\mathcal{B}(B \rightarrow D_s^+ K^- \ell^- \bar{\nu}_\ell) = (6.13^{+1.04}_{-1.03}{}_{stat.} \pm 0.43_{syst.} \pm 0.51(\mathcal{B}(D_s))) \times 10^{-4}$$

- Result in agreement with ARGUS measurement: $\mathcal{B}(B \rightarrow D_s^+ K^- \ell^- \bar{\nu}_\ell) < 5 \times 10^{-3}$
- BR too small to solve the BR puzzle

Conclusions

- ◆ Despite many years of measurements, puzzles in $B \rightarrow D^{(*,**)}\ell\nu$ remain
 - Branching fraction?
 - $|V_{cb}|$ and FF averages
 - Large rate for the broad components
 - Large difference between the BaBar and Belle results
 - Role of $D \rightarrow D^{(*)}\pi\pi$ decays
- ◆ $B \rightarrow D\ell\nu$ had a slow start, but can be potentially extremely interesting
 - We need unquenched lattice determinations of $G(w)$, $w=1$, $w>1$
- ◆ It is worth!!
 - $|V_{cb}|$ measurement is a B-factory legacy!!!

$$|V_{cb}| = (41.5 \pm 0.7) \times 10^{-3} \text{ (inclusive)}$$

$$|V_{cb}| = (38.7 \pm 1.1) \times 10^{-3} \text{ (exclusive)}$$

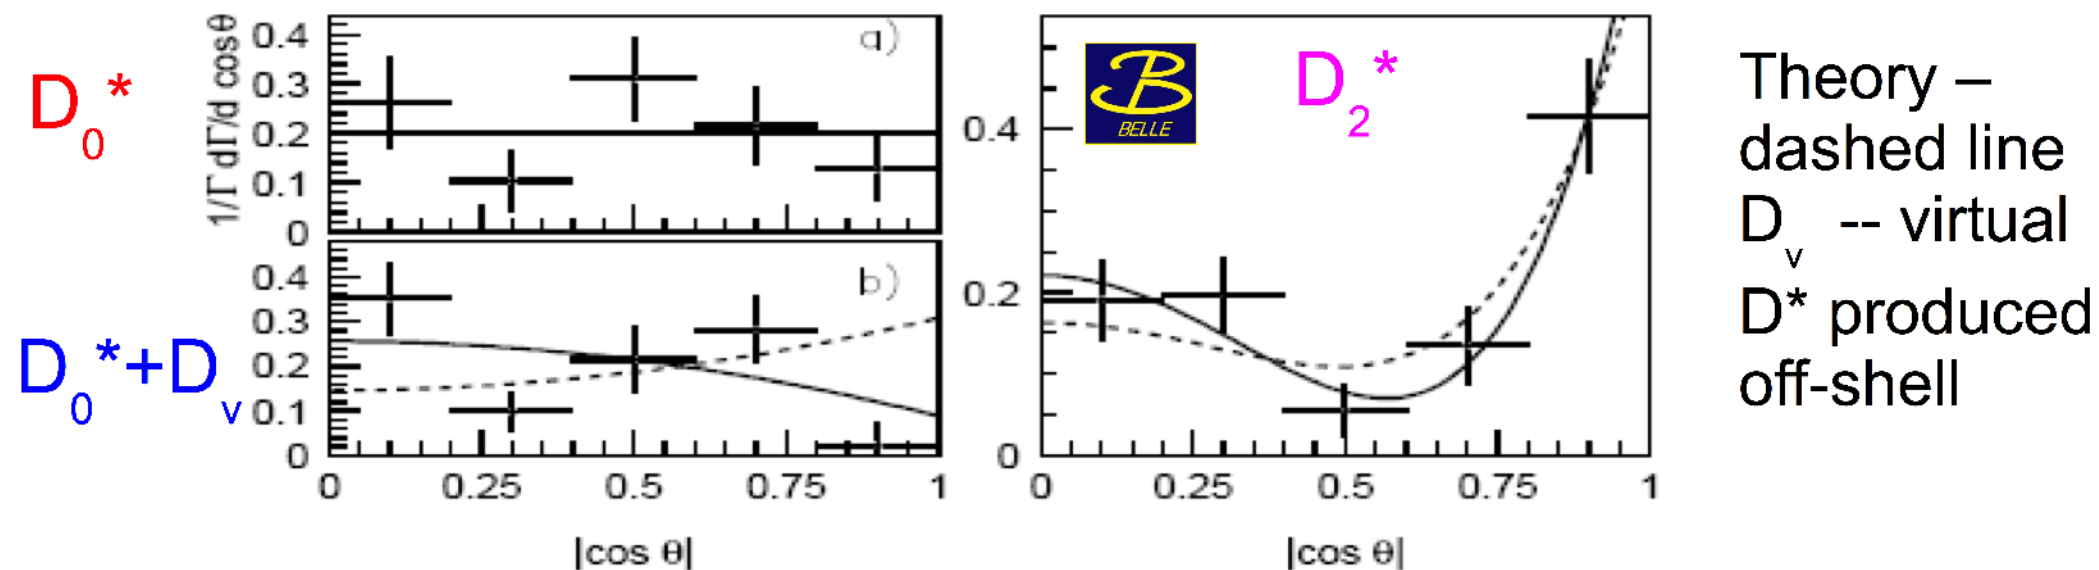

Backup Slides

On the $3/2$ vs $1/2$ puzzle

- Both Babar and Belle include the possibility for a non-resonant $D^{(*)}$ component, finding a rate consistent with zero
- A study of the helicity distribution can be used to confirm/not if the fitted “broad” component is consistent with the expected quantum numbers
- Belle only reports the helicity study for the $D_2(D\pi)$ and $D_0^*(D\pi)$ channels
- Fit of the invariant mass in helicity bins; fit **|hely|** with theoretical shapes for tensor and scalar states
- Confirm predictions for these two states

On the $3/2$ vs $1/2$ puzzle

- ◆ The helicity distributions can help in confirm the nature of the measured “broad” states, but current statistics is a problem
- ◆ It was also suggested (I. Bigi) that the measured broad states are radial excitations (p-wave)
- ◆ Also in this case, an helicity study could help, but statistics may be a limiting factor also for the full dataset/final measurement from BaBar and Belle

HFAG averages: Comments

HFAG average for $|V_{cb}|$ from $B \rightarrow D^* \ell \nu$ very challenging (measurements from almost 2 decades, very different assumptions: FF, BF etc.)
historically affected by very low χ^2 due to large spread of measurements
Subtle bug discovered, χ^2 improved, but still low (especially adding latest, very precise, measurements)

$B \rightarrow D^{**} \ell \nu$ (Narrow States, BaBar)

ArXiv:0808.0333 [hep-ex], PRL 103,051803(2009)

Fit $D^* \pi$ - D invariant mass distributions in 4 helicity bins, maximize D_1 - D_2

separation, also measure $\mathcal{B}(D_1 \rightarrow D\pi)/\mathcal{B}(D_1 \rightarrow D^*\pi)$ and D_1 polarization

$$\mathcal{B}(B^+ \rightarrow D_1^0 \ell^+ \nu_\ell) \times \mathcal{B}(D_1^0 \rightarrow D^{*+} \pi^-) = (2.97 \pm 0.17_{\text{stat}} \pm 0.17_{\text{syst}}) \times 10^{-3},$$

$$\mathcal{B}(B^+ \rightarrow D_2^{*0} \ell^+ \nu_\ell) \times \mathcal{B}(D_2^{*0} \rightarrow D^{(*)+} \pi^-) = (2.29 \pm 0.23_{\text{stat}} \pm 0.21_{\text{syst}}) \times 10^{-3},$$

$$\mathcal{B}(B^0 \rightarrow D_1^- \ell^+ \nu_\ell) \times \mathcal{B}(D_1^- \rightarrow D^{*0} \pi^-) = (2.78 \pm 0.24_{\text{stat}} \pm 0.25_{\text{syst}}) \times 10^{-3},$$

$$\mathcal{B}(B^0 \rightarrow D_2^{*-} \ell^+ \nu_\ell) \times \mathcal{B}(D_2^{*-} \rightarrow D^{(*)0} \pi^-) = (1.77 \pm 0.26_{\text{stat}} \pm 0.11_{\text{syst}}) \times 10^{-3}.$$

Observation of $B \rightarrow D_s K \ell \nu$

- Exclusive reconstruction

$$D_s \rightarrow \phi(K^+ K^-)\pi$$

$$D_s \rightarrow \bar{K}^{*0}(K^\pm \pi^\mp)K$$

$$D_s \rightarrow K_s^0(\pi^+ \pi^-)K$$

Feed Forward NN to suppress combinatorial bkg.

- lepton ($p_{lep} > 0.8 \text{ GeV}/c$) and Kaon added to D_s candidate
- Bkg from $B \rightarrow DD_s$ reduced using angular correlation between D_s and D (signal events no correlation)

~30% of D_s bkg rejected
